Fall 2025

**Michigan  
Technological  
University**

**Program Manager**

Sean Bennink  
[scbennin@mtu.edu](mailto:scbennin@mtu.edu)

**Principal Investigator**

Dr. Brad King  
[lbking@mtu.edu](mailto:lbking@mtu.edu)

**Chief Engineer**

Alex Wright  
[alwright2@mtu.edu](mailto:alwright2@mtu.edu)

# Who We Are

## Enterprise Objectives

**Educate the Future Leaders of the Aerospace Industry** by providing undergraduate students hands-on Space Systems Engineering project experience through the design, test, and integration of spacecraft.

**Advance U.S. Space Technology** by solving real-world, challenging problems. The satellites we build aren't just a student science project. These are real satellites, with real missions, that are directly relevant to current U.S. Military and NASA needs.

# Program Statistics

## Statistics

- Founded by Dr. Brad King in 2001 (now over 24 years old!)
- Helped 500+ students complete a senior design project and graduate
- Currently have 90 active members and continue to grow each semester
- Proudly home to 13+ different undergraduate majors
- Operate and maintain two MEEM lab facilities: the Aerolab and Clean Room
- Actively funded by two well-established aerospace companies: AFRL and NASA

**One satellite launched,  
with more on the way!**

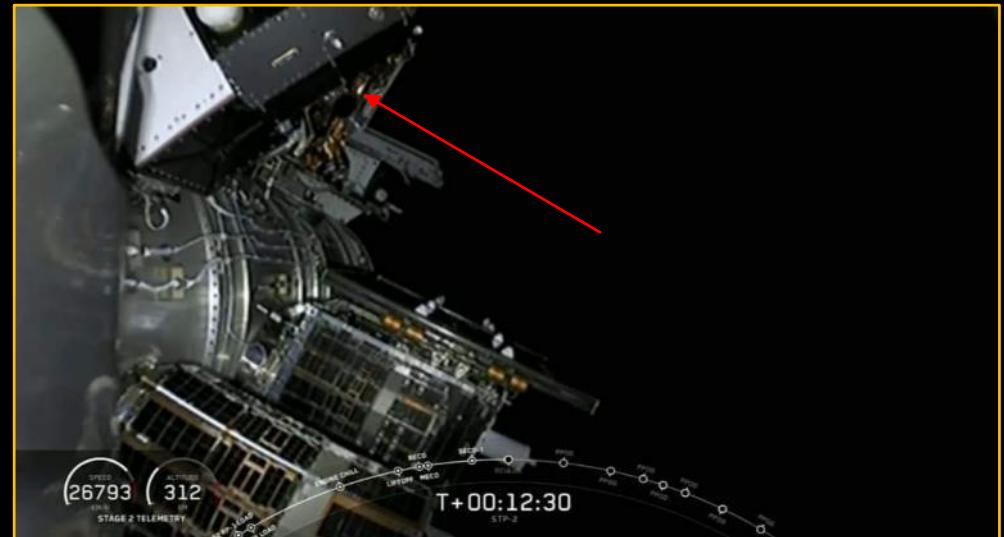

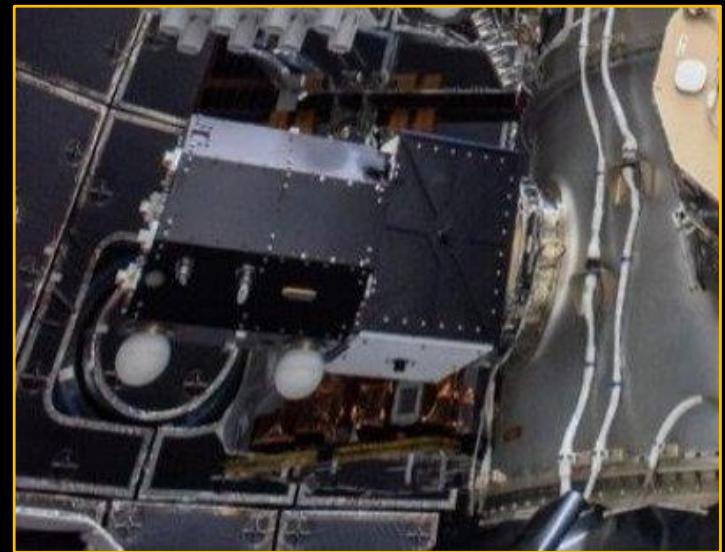

# Oculus Launch on STP-2

# Launch Event

In June 2019, the Oculus satellite was launched into space aboard a Falcon Heavy rocket. Hundreds of Enterprise members had a hand in the design and production of this spacecraft, some of whom are pictured below.

**Click here for Oculus orbit info!**

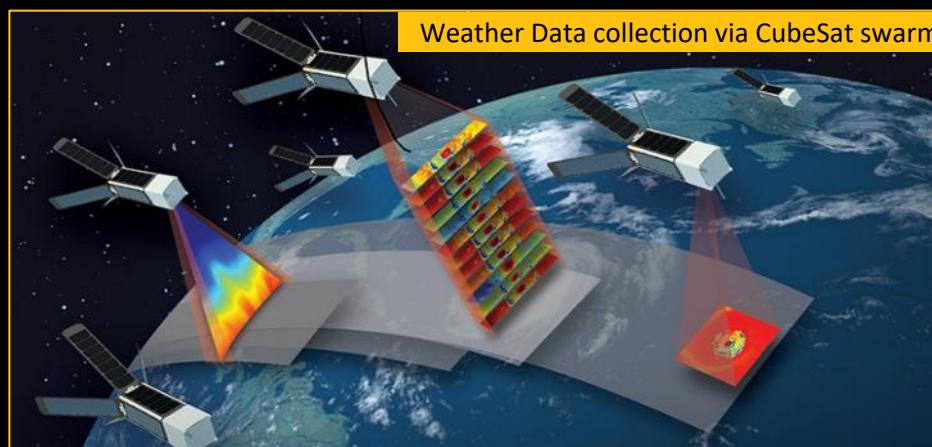

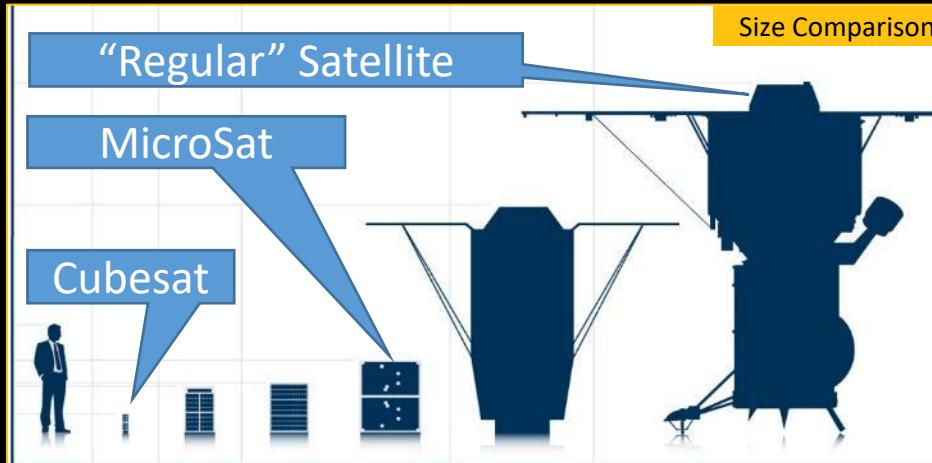

# NewSpace

## The NewSpace Race

The NewSpace race is driven by commercial interest, tech miniaturization, and lower costs. Space is easier to reach than ever before.

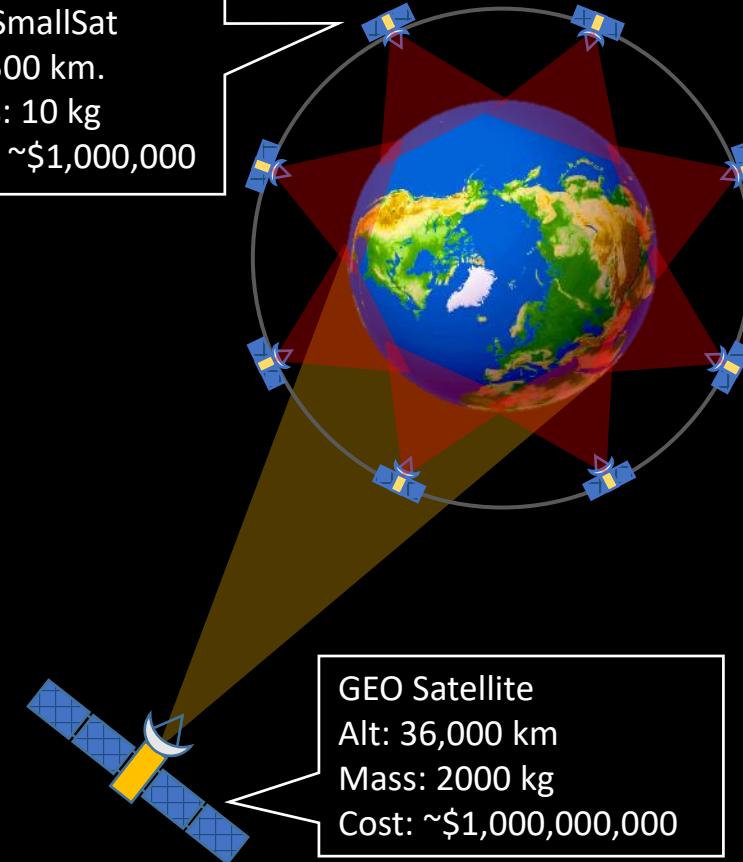

LEO SmallSat

Alt: 500 km.

Mass: 10 kg

Cost: ~\$1,000,000

Ex: Instead of 1 very large and expensive sat, we can instead place a constellation of smaller ones that are 1000x cheaper and 200x smaller. While SmallSats have less “capability”, this is mitigated in an economy of scale by increasing coverage.

# Currently Developing Missions

## Auris

Explore interference potential of GEO satellites by mapping their RF emissions onto Earth and determining their locations in space

## Stratus

Collect data on clouds and build 3D models of them to help climatology models.

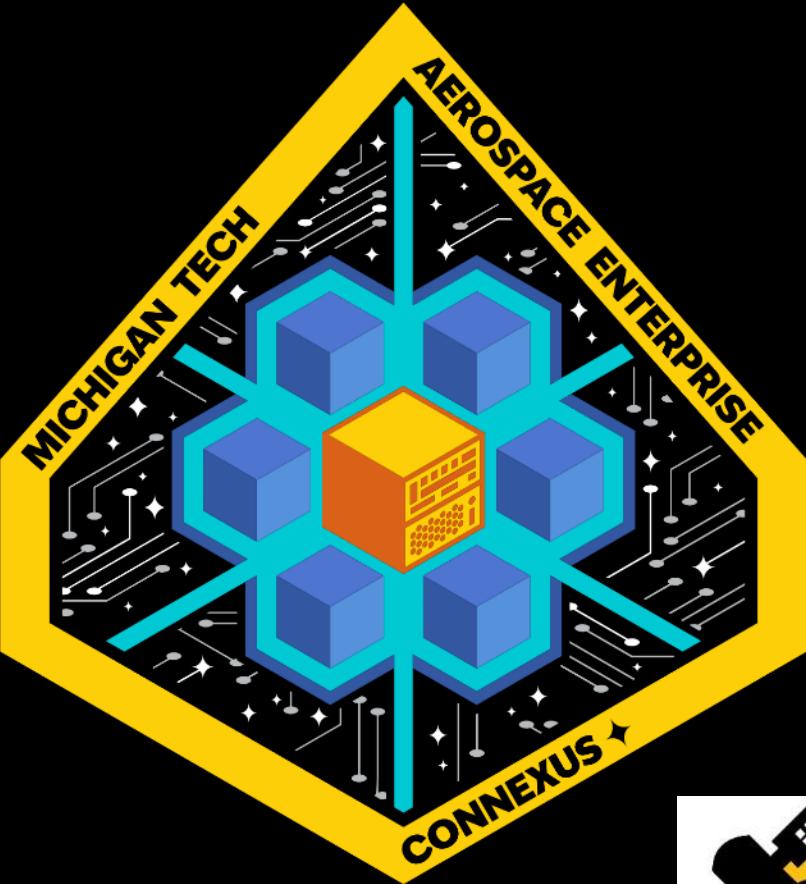

# Currently Developing Missions Cont.

## Descensus

Control a descent to earth within compact size requirements while maintaining pointing requirements

## Connexus

Store data and organize a locally stored database to structure the enterprise.

MICHIGAN TECH  
**AEROSPACE**  
ENTERPRISE

# Auris Mission Overview

**Program Manager**

Sean Bennink  
[scbennin@mtu.edu](mailto:scbennin@mtu.edu)

**Principal Investigator**

Dr. Brad King  
[lbking@mtu.edu](mailto:lbking@mtu.edu)

**Chief Engineer**

Alex Wright  
[alwright2@mtu.edu](mailto:alwright2@mtu.edu)

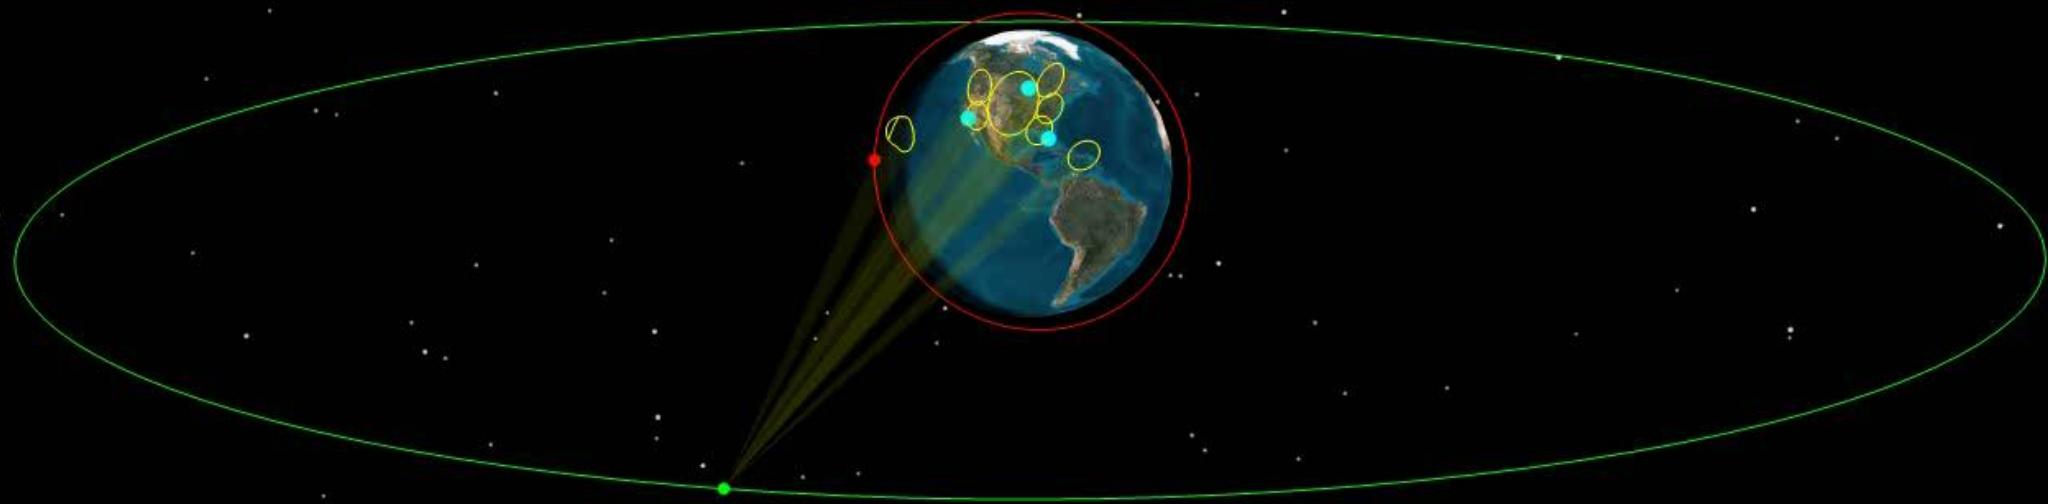

# Mission Statement

○ Auris Spacecraft

○ Auris Ground Receiver

○ GEO Emitter

○ GEO Emitter's Beam Pattern

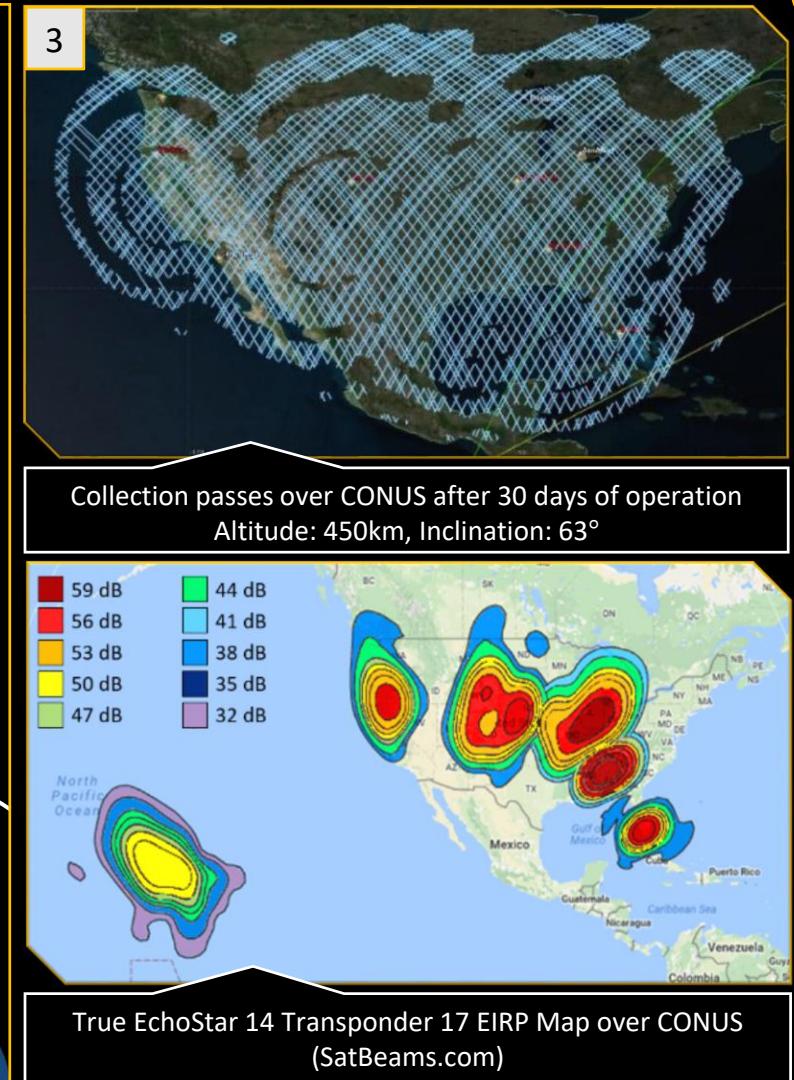

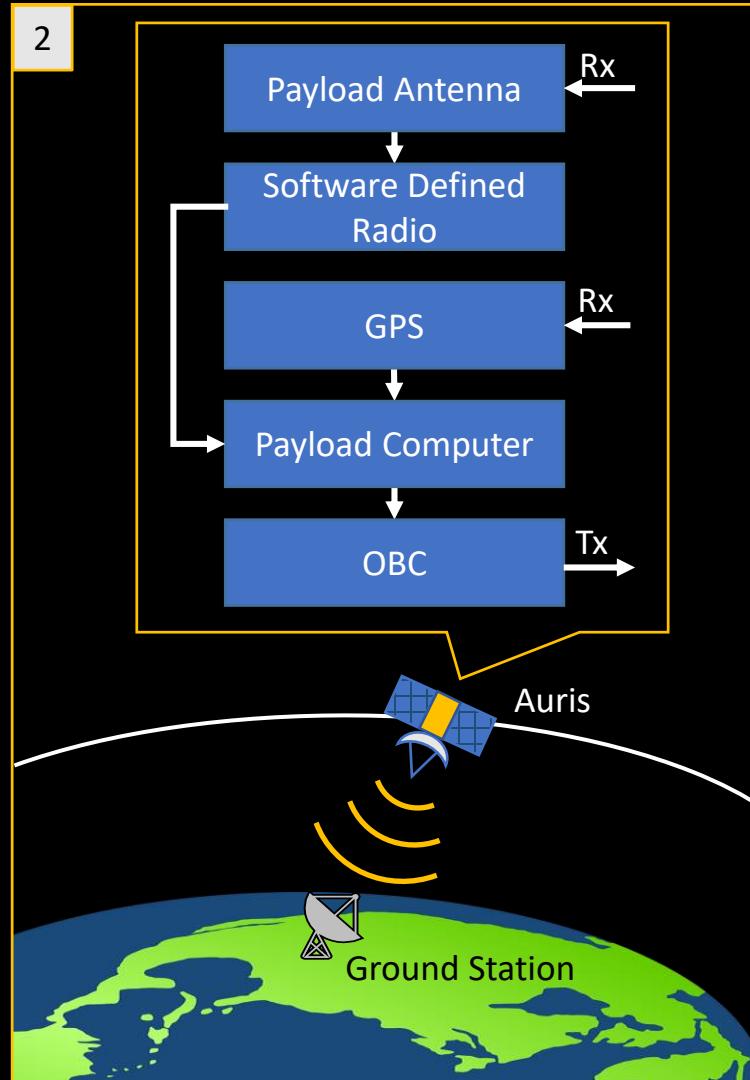

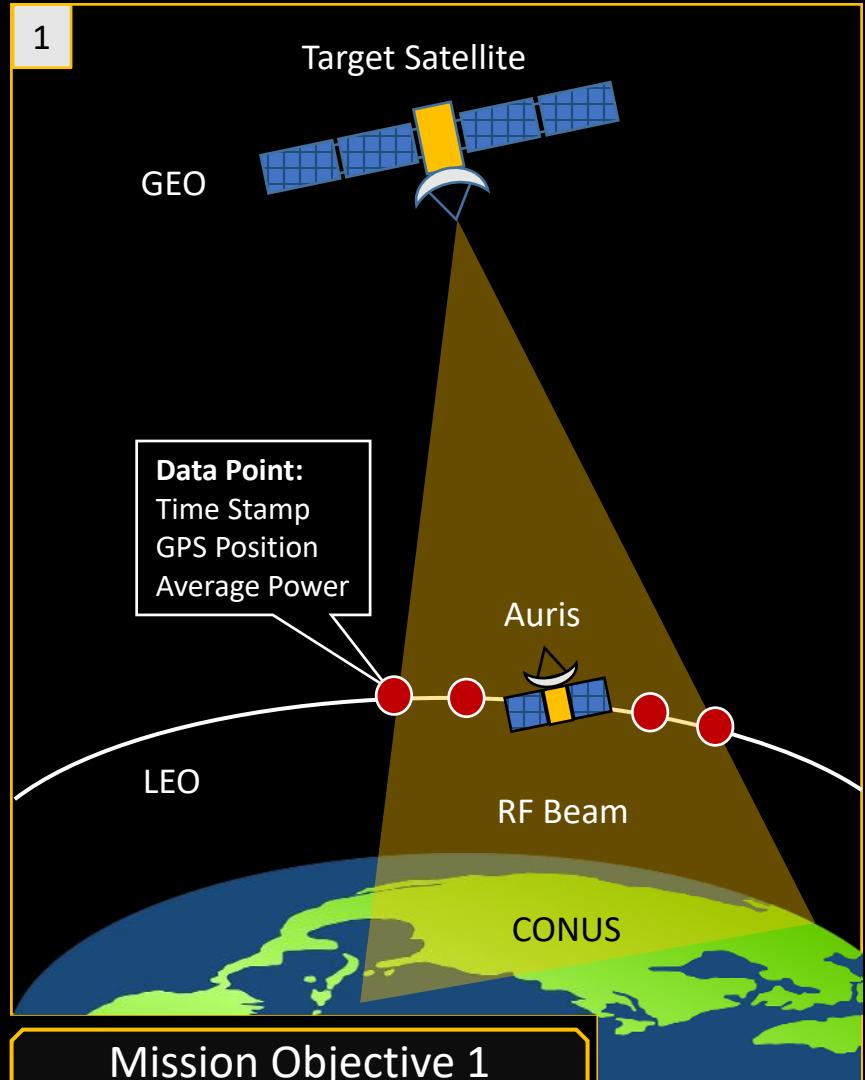

## Mission Statement

Auris is a pathfinder mission whose goal is to demonstrate a low-cost platform capable of exploring the interference potential of GEO satellites.

# Mission Objective 1

The Auris Mission shall produce, as a final data product, spatial maps of the antenna beam patterns radiated by EchoStar 14 Transponder 17 over the Contiguous United States (CONUS).

# Mission Objective 2

1

*GEO Emitter*  
 $t_e, X_e, Y_e, Z_e$   
*unknown*

A GEO satellite emits a signal at an unknown time and location.

*LEO Receiver*  
 $t_1, x_1, y_1, z_1$

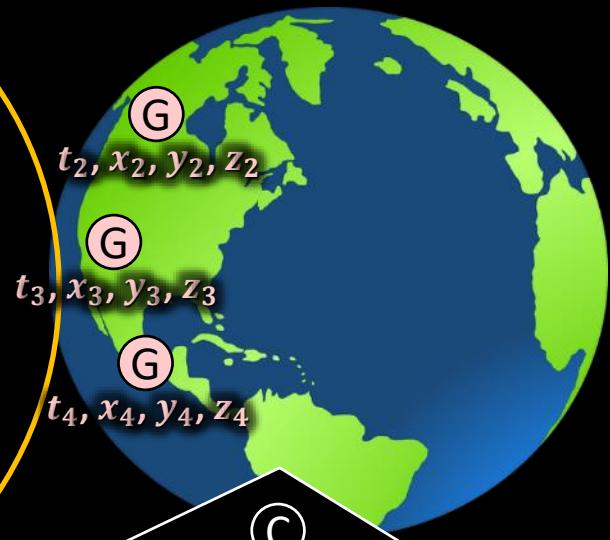

B

Auris receives signal from the GEO Emitter first at a known position and time. Data are stored and forwarded to ground.

Three ground assets (GroundSats) receive signal from the GEO emitter at known positions and times. Data are aggregated and forwarded for post-processing.

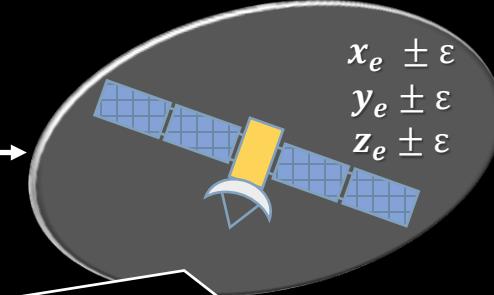

C

2

$t_1 \pm \varepsilon, x_1 \pm \varepsilon, y_1 \pm \varepsilon, z_1 \pm \varepsilon$  →  
 $t_2 \pm \varepsilon, x_2 \pm \varepsilon, y_2 \pm \varepsilon, z_2 \pm \varepsilon$  →  
 $t_3 \pm \varepsilon, x_3 \pm \varepsilon, y_3 \pm \varepsilon, z_3 \pm \varepsilon$  →  
 $t_4 \pm \varepsilon, x_4 \pm \varepsilon, y_4 \pm \varepsilon, z_4 \pm \varepsilon$  →

**Ground Post-Processing**  
*Constrained Optimization*

$x_e \pm \varepsilon$   
 $y_e \pm \varepsilon$   
 $z_e \pm \varepsilon$

**Mission Objective 2**

Position and timing data are used to “backtrack” source of RF emission to a location in space within an ellipsoid of confidence.

MICHIGAN TECH  
**AEROSPACE**  
ENTERPRISE

# Stratus Mission Overview

**Program Manager**

Sean Bennink  
[scbennin@mtu.edu](mailto:scbennin@mtu.edu)

**Principal Investigator**

Dr. Brad King  
[lbking@mtu.edu](mailto:lbking@mtu.edu)

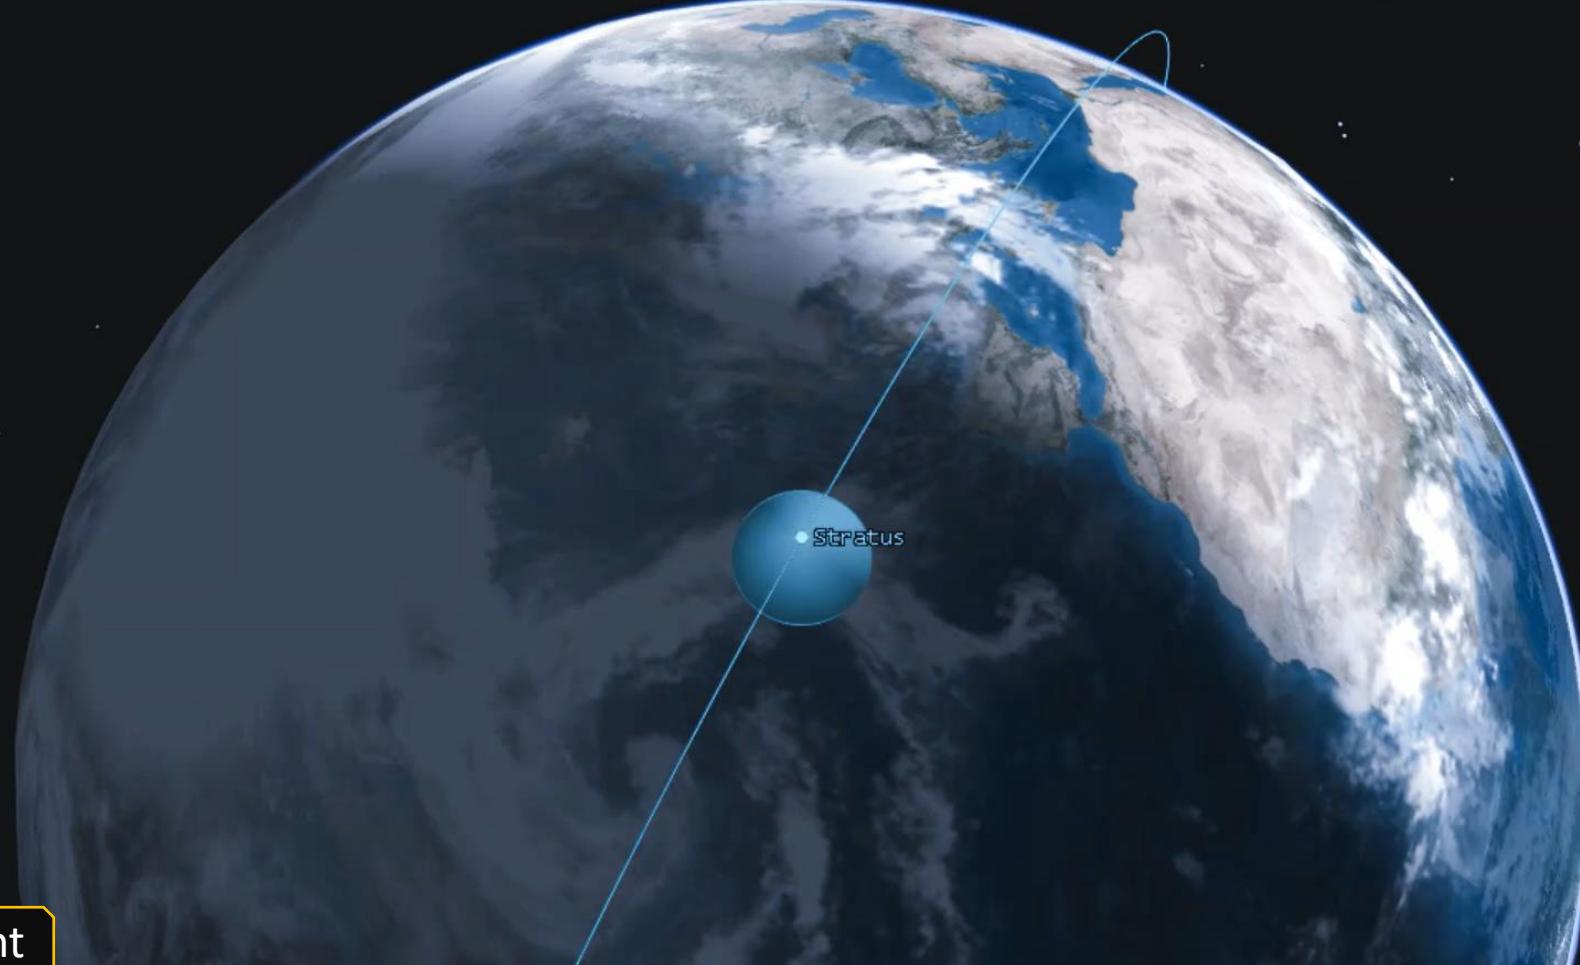

**Chief Engineer**

Alex Wright  
[alwright2@mtu.edu](mailto:alwright2@mtu.edu)

# Mission Statement

Approved AGI Educational Alliance Partner

## Mission Statement

The Stratus mission shall demonstrate an inexpensive, upwardly scalable architecture capable of imaging clouds and generating usable data for validating and improving existing solar irradiation models.

# Mission Objectives and Motivation

## Mission Objective #1

Capture high-resolution images of cloud cover over the Keweenaw Peninsula and successfully downlink to Earth.

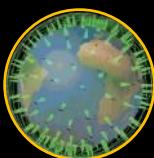

## Mission Objective #2

Process Stratus images taken to calculate cloud fraction over the Keweenaw Peninsula for one year.

## Mission Objective #3

Assess the solar viability of regions by using the Stratus cloud fraction data in conjunction with solar irradiance models.

### Scalability

The Stratus Mission can be scaled upwards to increase frequency of data collection and coverage due its modular CubeSat body and efficient design. Hardware can be upgraded frequently with each new addition to a Stratus constellation

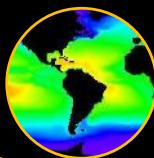

### Cost

"It was a billion-dollar spacecraft on a \$110 million rocket, not counting the cost of the instruments and algorithms"\*. Large satellites (such as the Terra Spacecraft) are expensive to produce. CubeSats such as Stratus offer a route to accomplish similar goals, but at a greatly reduced cost. Stratus is projected to cost \$200,000.

### Research

Understanding and predicting how regional cloud cover influences solar viability and climate adaptation is essential—both economically and societally. Stratus can capture high-resolution cloud fraction data, thereby significantly bridging gaps in existing solar irradiance and critical climate research models.

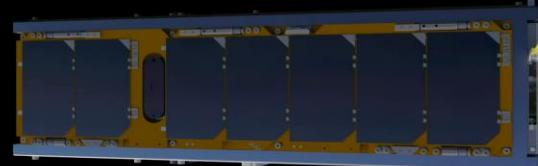

### Why Stratus?

### Education

The Michigan Tech Aerospace Enterprise exists to offer students a means of gaining hands-on experience in space systems engineering. The development of Stratus and other satellites will give participants the experience required to lead successful careers in the Aerospace field.

### Spacecraft

### Why Join Us?

- Launch Date SOON!
  - End of 2026
- Need more people to make that happen

### Majors of Interest:

Software  
Engineering

Electrical  
Engineering

Computer Science

Any others are  
welcome!

### What needs to be done?

- Finish the Mission Code to make satellite mission ready
- Battery Testing and battery analysis
- Develop Mission Operation Plan
- Finalize Imager code to conduct research with
- Launch!!!

# Mission Overview

## Mission Statement

Connexus shall be a secure remotely accessible workflow management database facilitating collaborative development, task management, and lab based test and equipment.

## Outcomes

- Connexus database and software package
- Server and Database Management (SDM) subteam

## Features

- Remote accessible through website GUI
- Database on server that stores and organizes data
- Workflow management system
- Simulation Computer
- Host Enterprise GitLab
- Finance tools and budgeting

# Connexus Subsystems

Centralized File System

Project Management

Simulation

Financial Manager

Personnel Tracker

Onboarding

Inventory Management

API Integration

Mission Station

SDM Subteam

User Interface

Gitlab Server

## Phase A

Minimum Viable Product (MVP)

Estimated Completion Date: End of Spring 2026

### User Trade Studies

- Interviews with each subteam
- SRR

### New Features:

- Sharepoint drive
- Personnel trackers
- Simulation Computer + Station
- Basic GUI

## Phase B

Fully Functional Product

Estimated Completion Date: End of Spring 2027

Connexus satisfies all requirements

### New Features:

- Fully operational GUIs
- Finance Manager
- Project Management

## Phase C

Upkeep and Maintain

Estimated Completion Date: **Never**

Launch of SDM

### New Features:

- SDM Task Group (IT team)
- Periodic updates
- Bug fixes

# Descensus Mission Overview

**Program Manager**

Sean Bennink  
[scbennin@mtu.edu](mailto:scbennin@mtu.edu)

**Principal Investigator**

Dr. Brad King  
[lbking@mtu.edu](mailto:lbking@mtu.edu)

**Chief Engineer**

Alex Wright  
[alwright2@mtu.edu](mailto:alwright2@mtu.edu)

## What is Cansat?

Fast-paced, competitive year long experience participating in a complex engineering project from conceptual design to operation and conclusion.

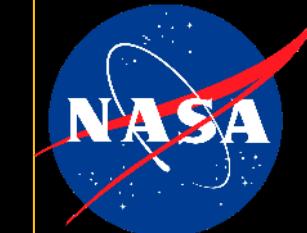

- Run by the American Astronomical Society (AAS)
- Design a payload to attach to the front of a rocket according to competition guidelines
- Perform science objectives while in flight

## Competition Sponsors

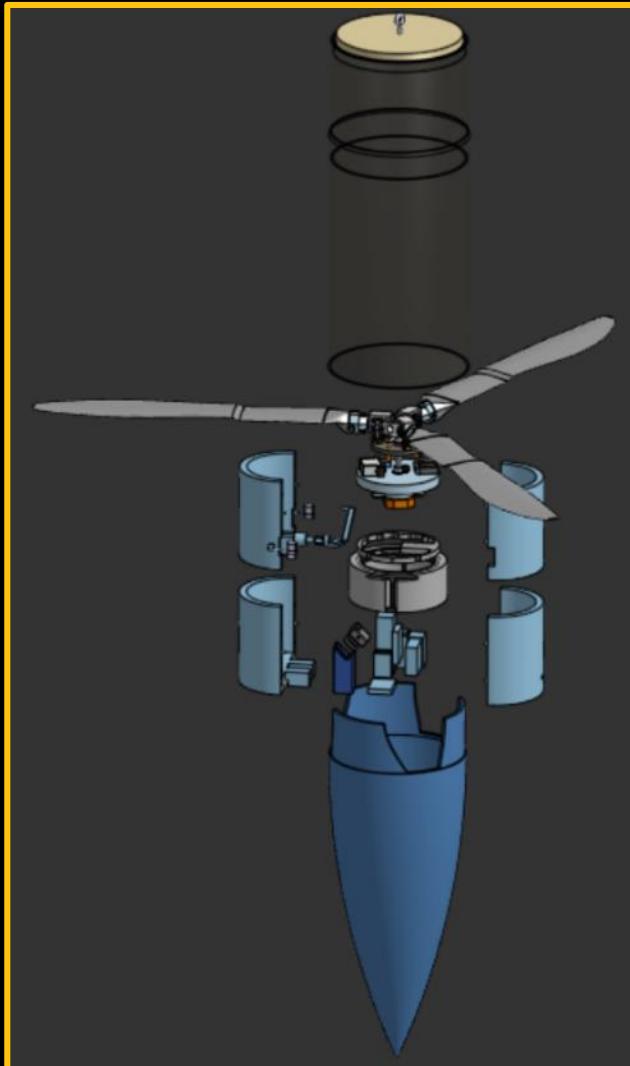

**SIEMENS**

**PRAXIS** INC.

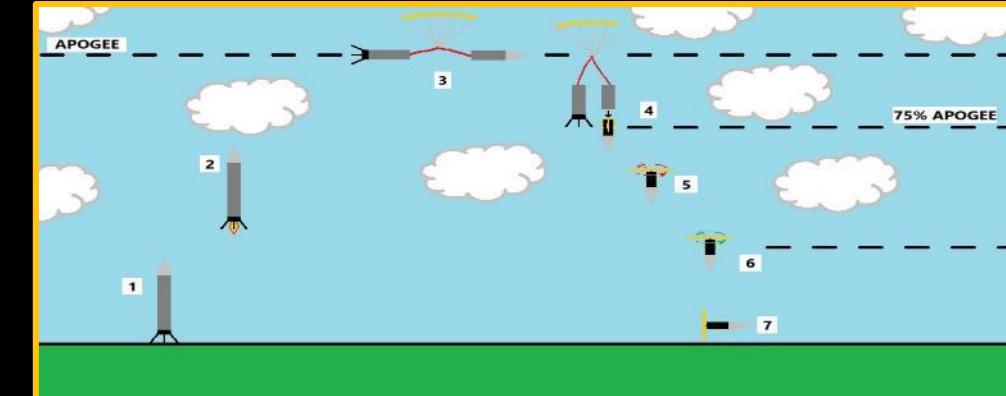

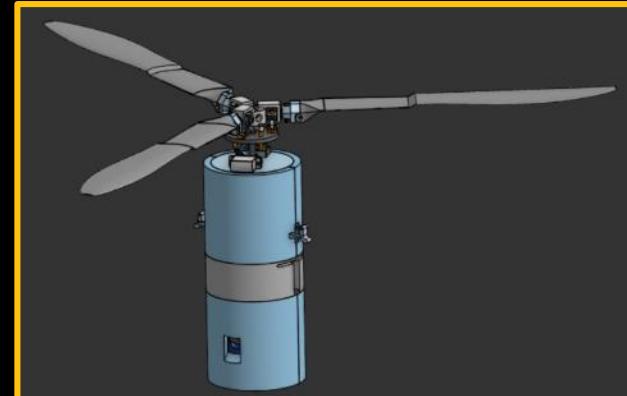

**LOCKHEED MARTIN**

## What We Do

- Ten month, annual schedule focused on the development of a payload
- New program for the Enterprise - 2024 start
- Overview: Yearly scientific/performance objective to compete in a pool of 40 international teams.

### Why join CANSAT?

- Hands on experience from the start
- Variety of skills available to learn & develop
  - Design, software, basics of rocketry, electrical, etc.

### Key skills we are looking for:

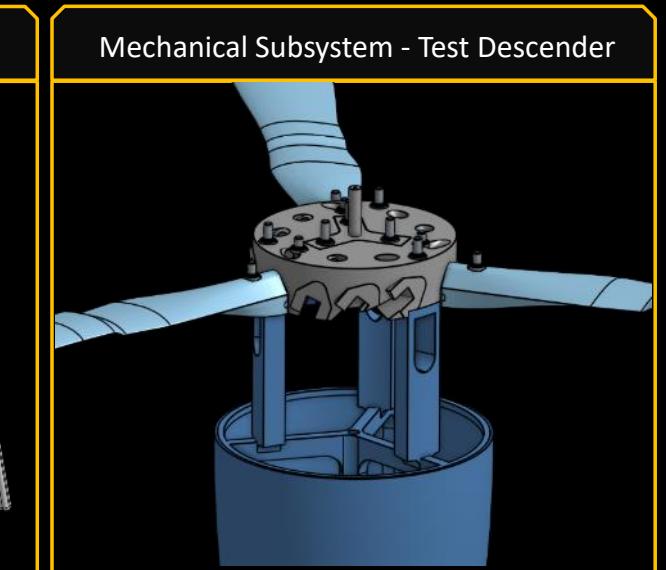

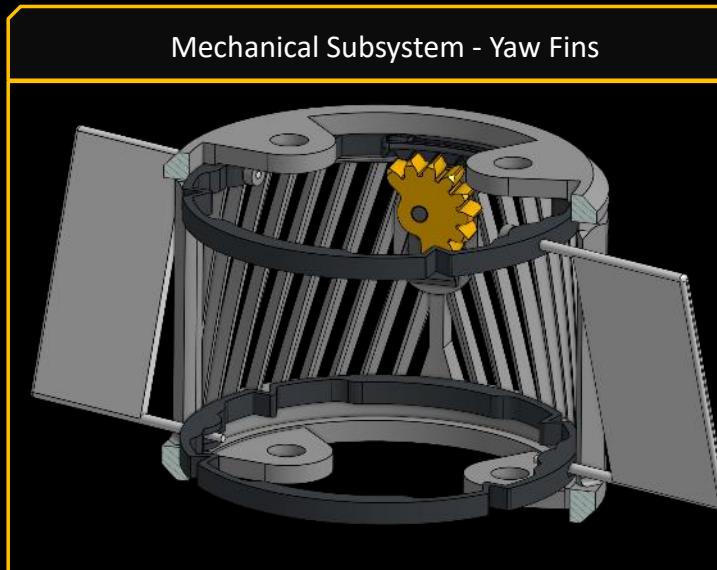

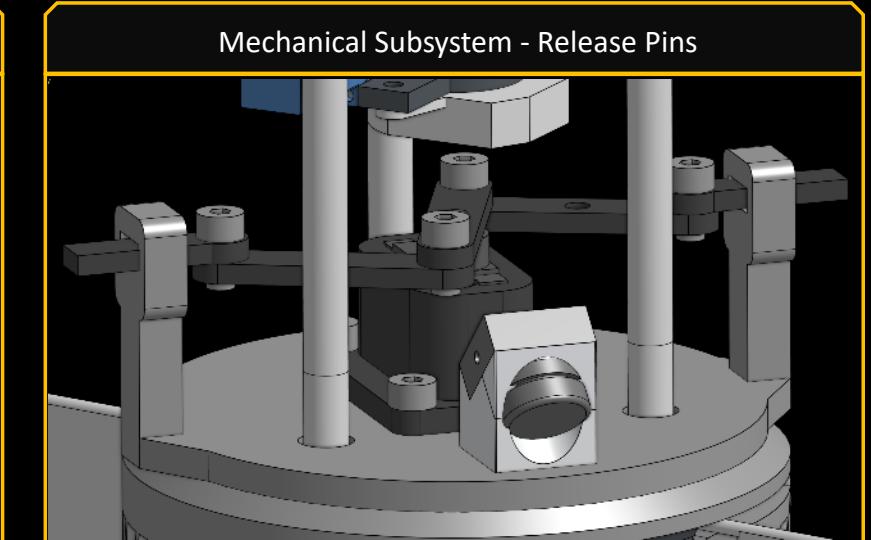

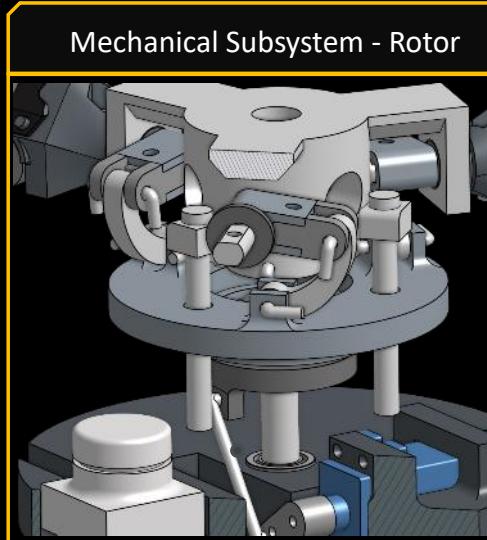

- CAD - OnShape or relevant suite.
- Simulation - FEA, CFD
- Robotics
- Electronics
- Model Rocketry
- Multi-language, back & front-end software work

Descensus Info Session

# 2025 Design Summary

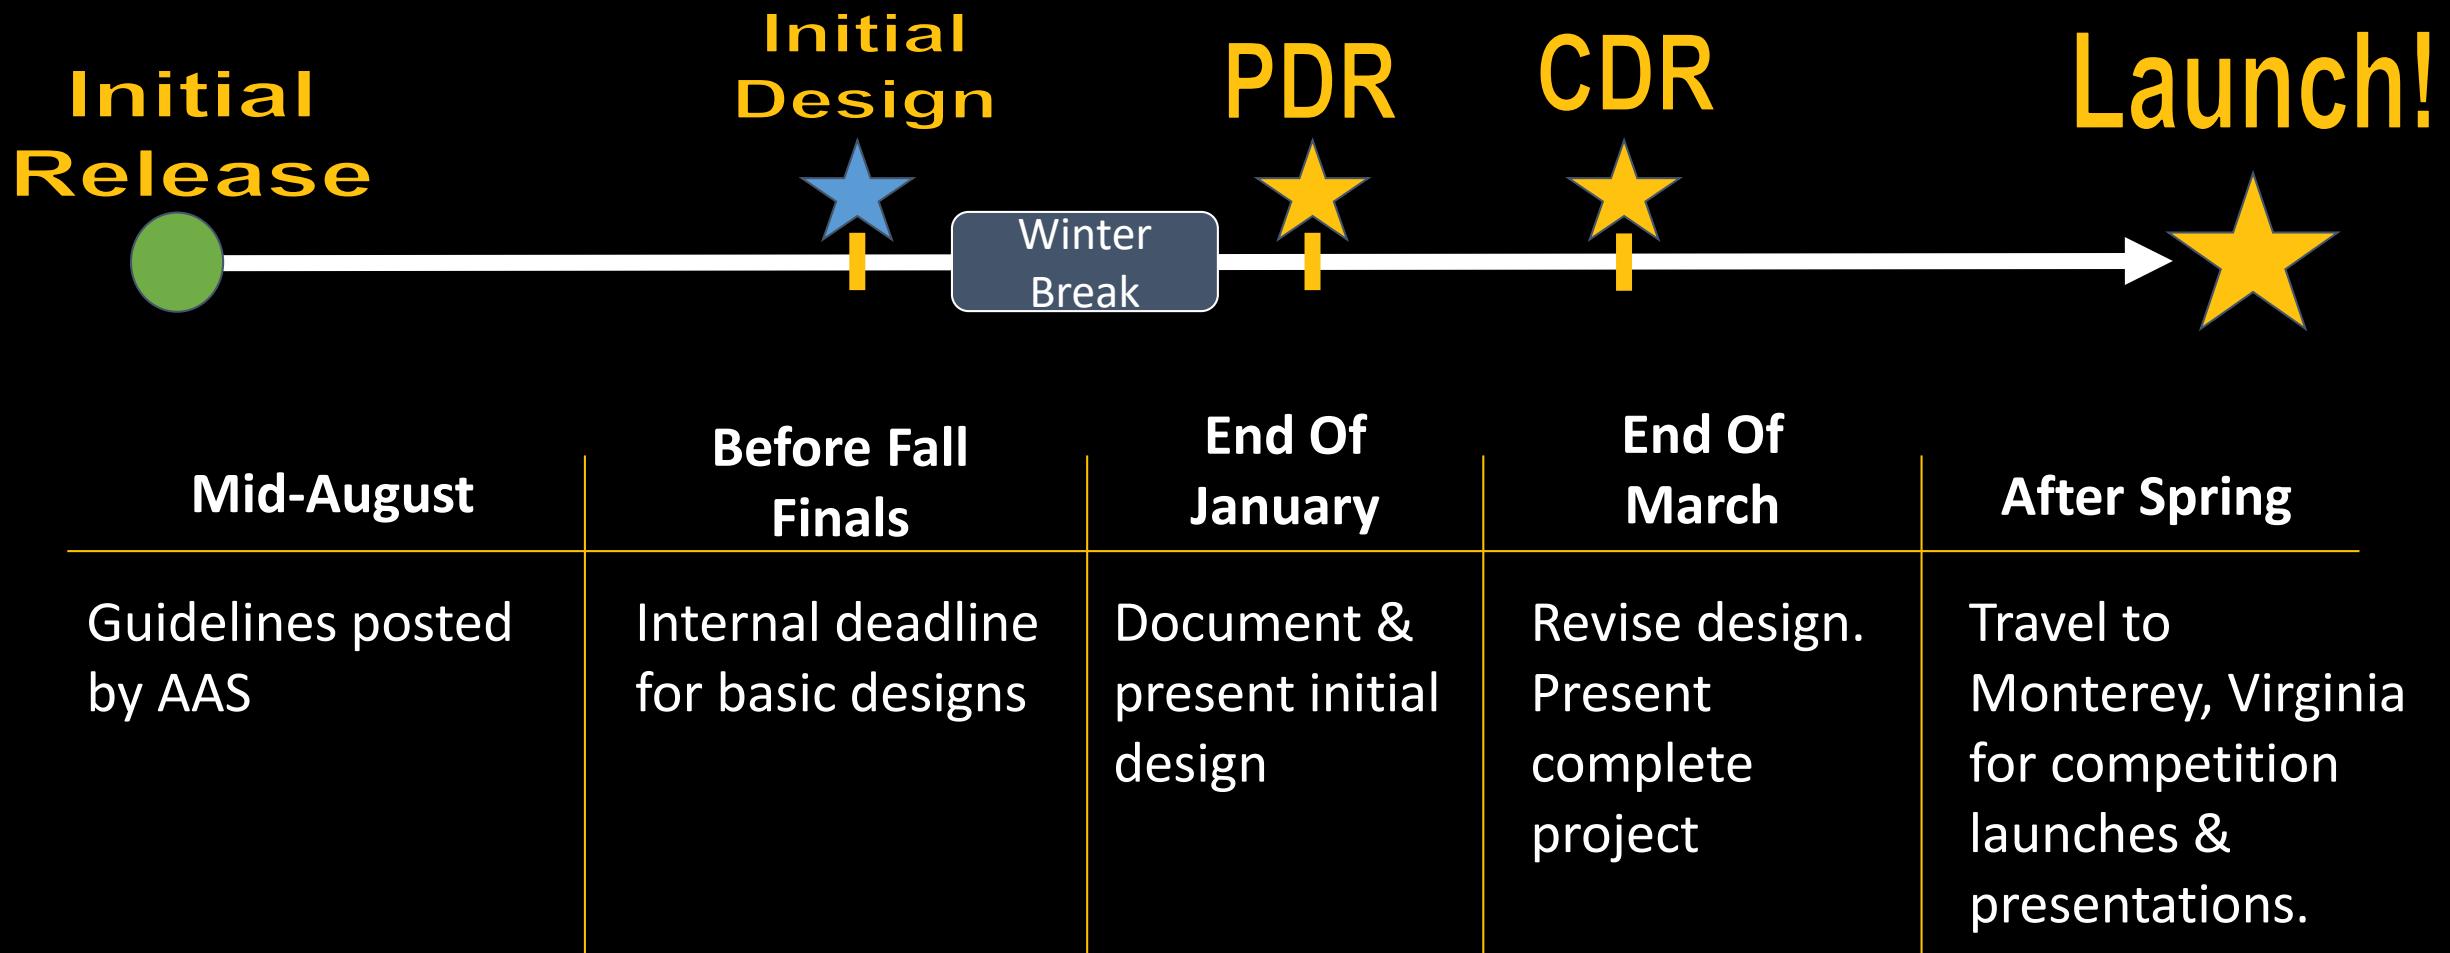

## This Year - 2026 Competition - Descensus II

“It’s a bird! it’s a plane! it’s a paraglider?”

- We are tasked with developing a paraglider system for the delivery of a “sensitive instrument” (egg) to a target drop zone.
- Drop zone distinction has been identified as a set of coordinates - around 200 meters from launch site
- Flight Stages: ascent -> apogee + shell separation via rocket charge -> first 20% of apogee is parachute descent within shell -> @80% peak altitude the glider separates for navigation to the target zone -> 2 meters of altitude above the target, the egg compartment shall be released for final descent onto the target.

# What can I do on the team?

## Mission Sciences

- Data Analysis/Science
- Error Budgets
- RF Simulations & Design
- Requirement Definition
- Mission Design
- Payload Development
- Risk Analysis
- Orbital Mechanics

## Modeling and Simulation

- FEMAP Nastran
- SolidWorks
- Thermal Desktop
- Matlab/Simulink
- LabView
- Python
- STK (Orbital Simulations)

## Software

- Embedded systems
- Hardware-level Drivers
- Mission Code
- User Interfaces
- Web Design

## Hardware

- Antennas
- FPGAs
- Power Electronics
- PCB Design & Fabrication
- Thermal Imagers
- Software Defined Radios
- Control Systems
- Signal Processing
- Hardware Testing
- Etc.

## Fabrication & Assembly

- 3D Printing
- Clean Room Operations
- Support Equipment
- Machining
- Structural Assembly
- Hardware Assembly

## Business & Leadership

- Presentations & Reviews
- Leading a team
- Financial management
- Hardware Procurement
- Recruitment & Outreach
- Schedule Management
- Marketing

There is meaningful work for almost **every** major that wants to join!

# How is the Work Distributed?

We have *nine* current subteams on the Enterprise, each with unique project work!

## A-PYL

Mission Science & Data Processing  
RF Engineering, Signal Processing,  
Software and Network Engineering

Mission Specific, Auris

## ADC

Attitude Determination & Control  
Physics, Orbital Mechanics, Systems  
Engineering, Optics

## COM

Telemetry Communications  
RF Engineering, Communications,  
Signal Processing, Software

## EPS

Power Collection, Storage, & Dist.  
Power Engineering, Test Engineering,  
PCB Design

## GSE

Ground Testing & Facilities Support  
Electrical Engineering, Mechanical  
Engineering, Power Engineering

## OPS

Mission Planning & Operations  
Mechanical Engineering, Orbital  
Mechanics and Simulations

## SFW

Mission Software & Data Handling  
Mission Code, Subsystem Drivers,  
Command & Data Handling

## STR

Spacecraft Structure & Support  
3D Modeling, Mechanical Drawings,

# Auris-Payload (A-PYL)

**Team Leader**  
Kellen Minyon  
[krminyon@mtu.edu](mailto:krminyon@mtu.edu)

**Systems Engineer**  
Matthew Holwerda  
[msholwer@mtu.edu](mailto:msholwer@mtu.edu)

# Auris-Payload Overview

## What do we do?

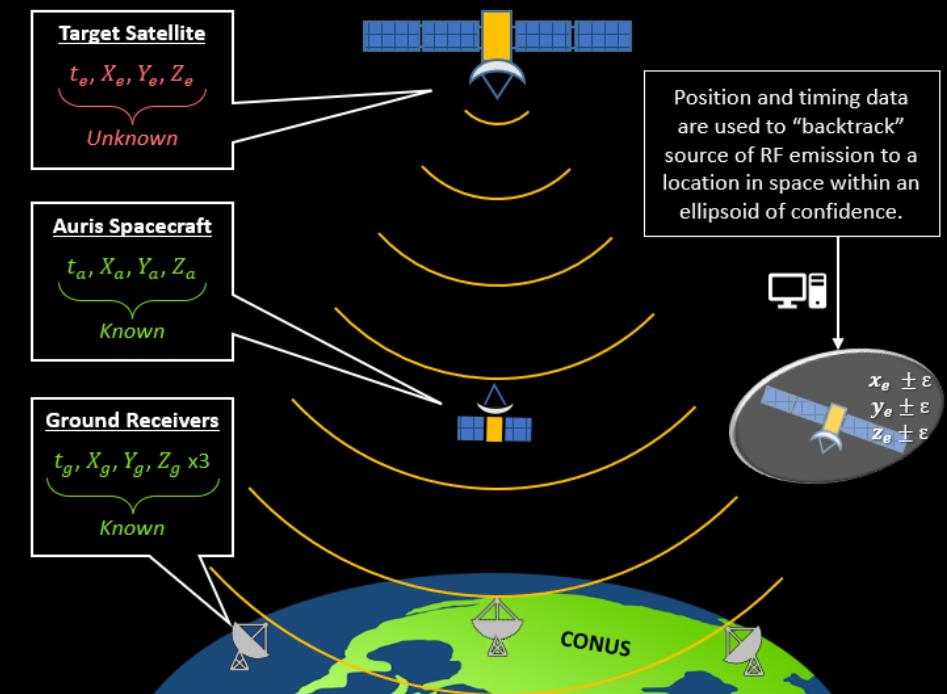

- Figure out the underlying mission science
- Develop the payload subsystem
- Coordinate with the other subteams on the enterprise
- Perform relevant tests

## What kind of work do we do?

- MATLAB Simulation
- C/C++, Python Programming
- RF & Antennas!
- Systems Engineering
  - Requirements & Verification
  - Test Design
- Assembly, Integration, and Testing (AI&T)
- Mission Science Analysis
- Signal Processing & Communication Systems
- Electrical Design

## Who are we looking for?

- Electrical Engineers
- Computer Engineers
- Computer Science
- Or anyone who is interested and willing to participate in our work!

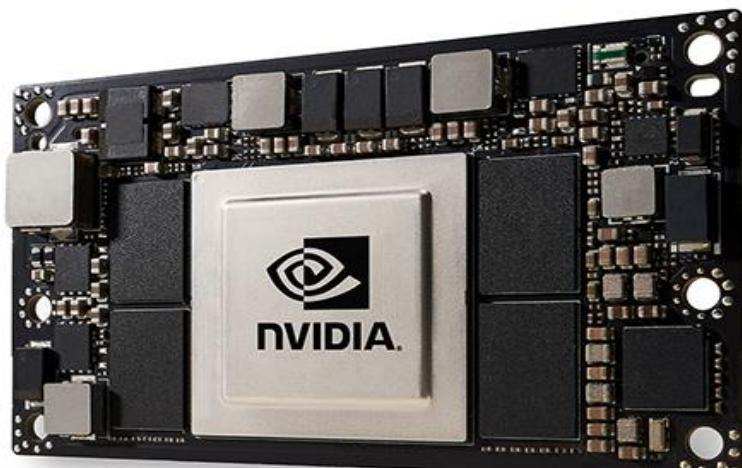

# Auris-Payload Projects

## Software

Program an NVIDIA Jetson TX2i to control the payload and crunch some *serious* numbers!

## Ground Satellite

Make a Ground Satellite system that will be distributed across the continental US!

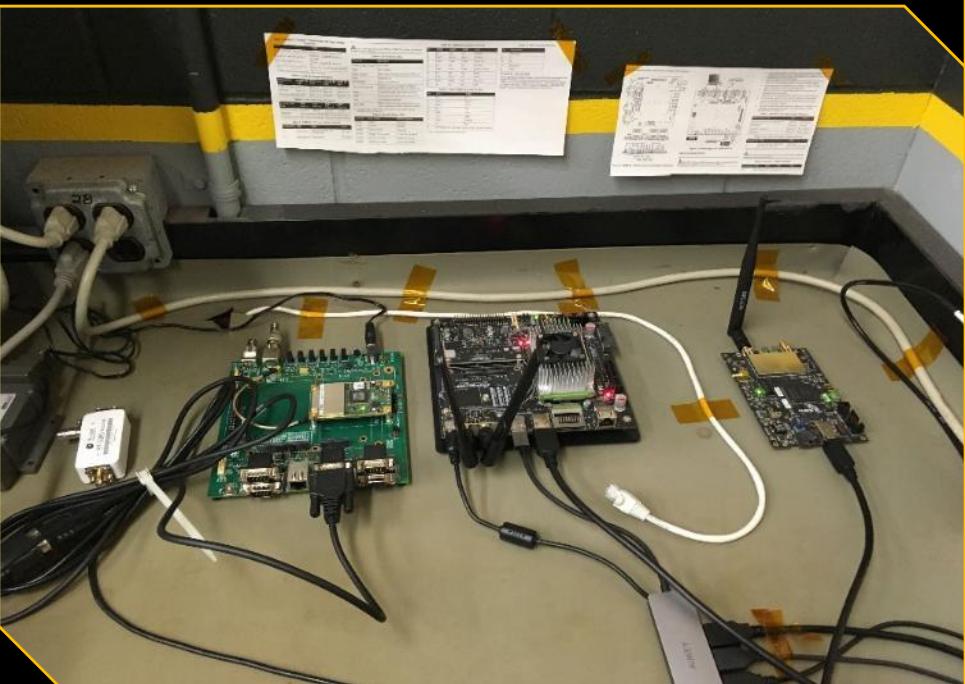

# Auris-Payload Projects

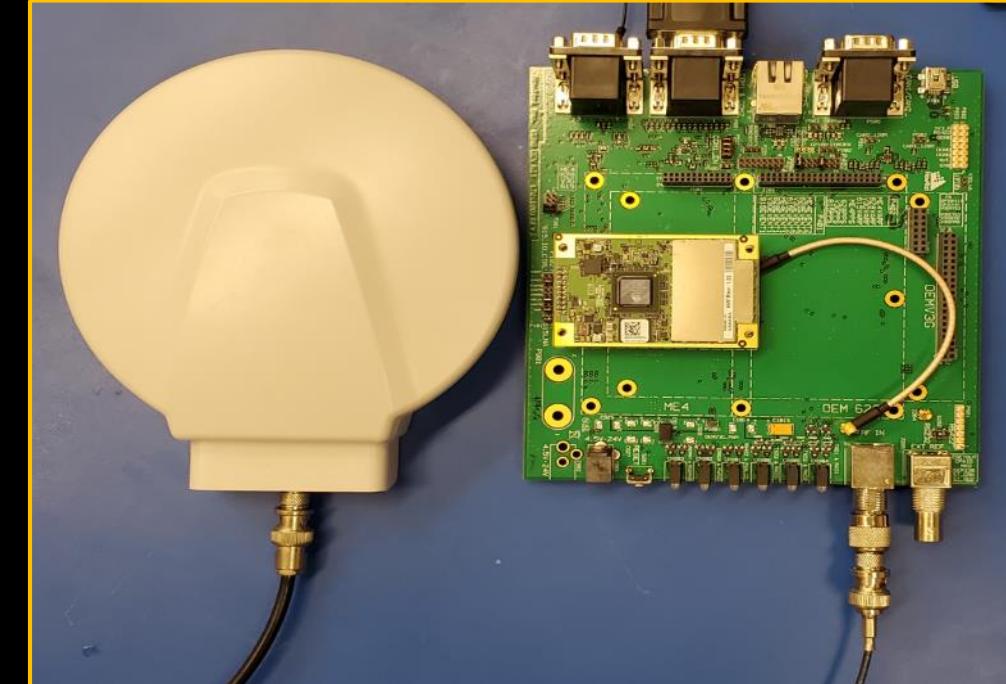

## Radios & Signals

Command a Software-Defined Radio to capture signals from other satellites!

## GPS

Program and wire up a GPS unit to provide position info and nanosecond timing accuracy!

And Much More...

MICHIGAN TECH  
**AEROSPACE**

# Attitude Determination & Control ADC

**Team Leader**

Isaac Oldenburg  
[ijoldenb@mtu.edu](mailto:ijoldenb@mtu.edu)

**Systems Engineer**

Henry Berghoef  
[hberghoe@mtu.edu](mailto:hberghoe@mtu.edu)

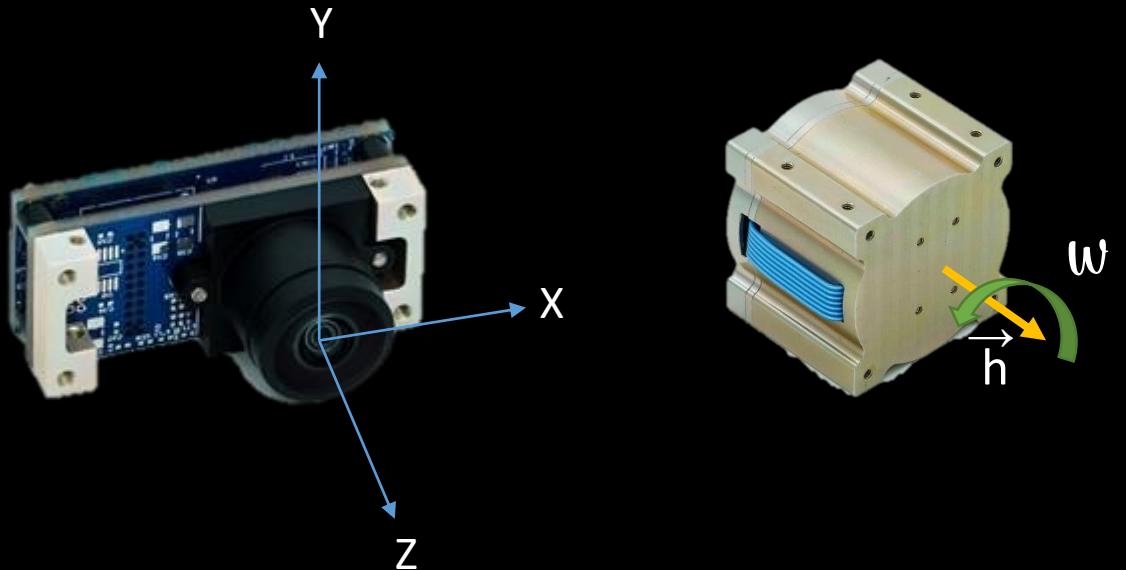

ADC

# ADC Overview

Main responsibilities of ADC:

- Identify where the satellite is pointed
- Change and maintain the orientation of the satellite to achieve target position

ADC

# ADC Responsibilities

## Potential Projects:

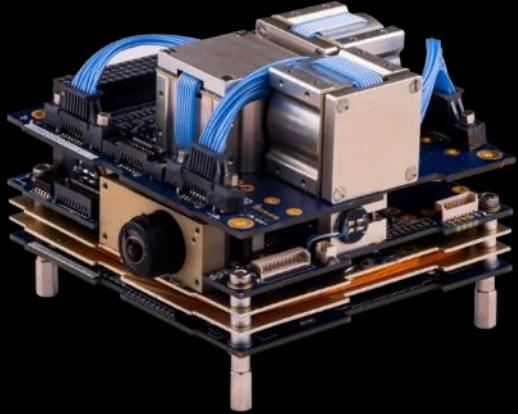

- Determine ADC hardware for future satellites
- Verify proper control to meet requirements using simulations and astrodynamics analyses
- Work with numerous different complex sensors and actuators
  - Fun Fact – ADC has the most components in the enterprise!
- Conduct hardware testing

ADC

# ADC Components

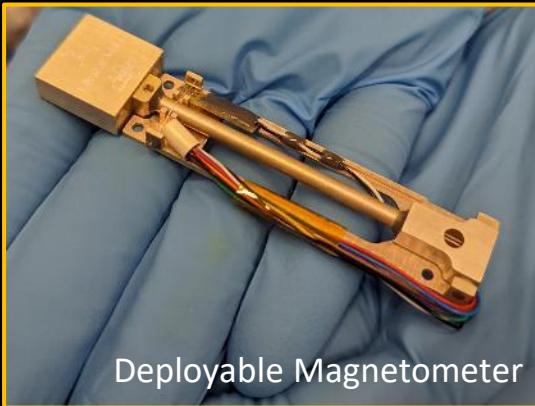

Fine Sun Sensor

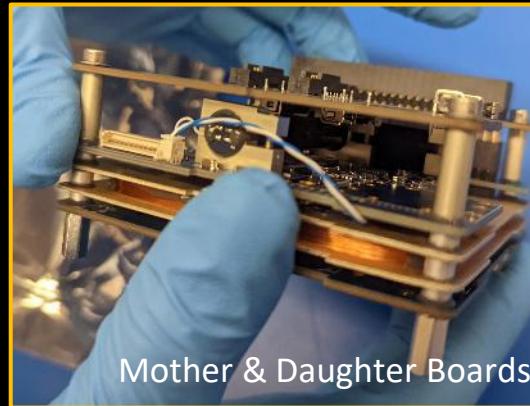

Star Tracker

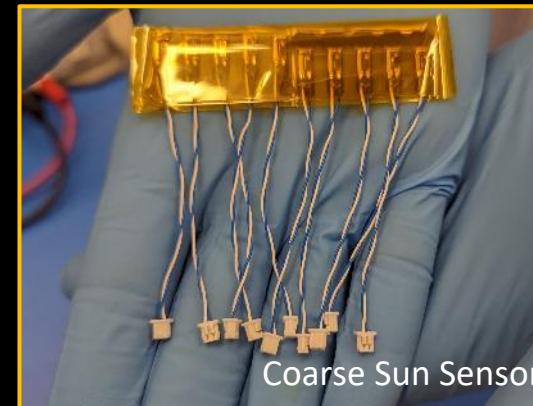

IR Nadir

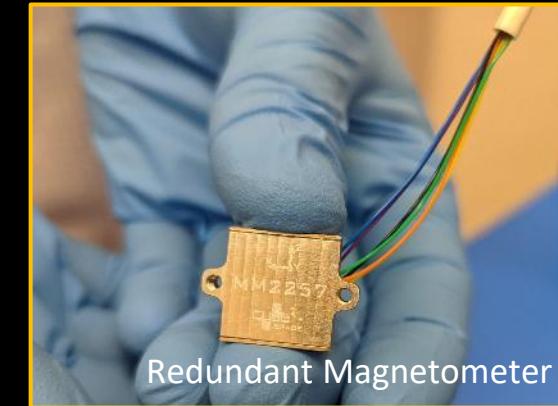

Deployable Magnetometer

Mother & Daughter Boards

Coarse Sun Sensor

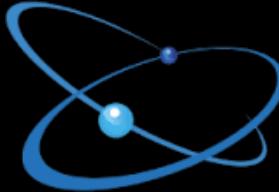

Redundant Magnetometer

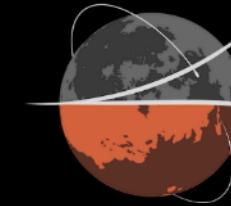

ADC

# Join Us and Elevate your Potential

**ORBION**  
SPACE TECHNOLOGY

**HUSKYWORKS**  
PLANETARY SURFACE TECHNOLOGY DEVELOPMENT LAB

**Halla**  
Mechatronics

## Open to all majors!

- Prior experience not necessary
- Learn how to build a satellite
- Gain experience in design, documentation, hardware testing, and simulations
- Apply what you have learned in classes
- ADC members have obtained valuable internships and jobs with experience gained working with the Enterprise

**Astronautics**  
INNOVATION THROUGH SPACE

MICHIGAN TECH  
**AEROSPACE**  
ENTERPRISE

# Communications (COM)

**Team Leader**

Martin Wilkens  
[mdwilken@mtu.edu](mailto:mdwilken@mtu.edu)

**Systems Engineer**

Conner Larson  
[cdlarson@mtu.edu](mailto:cdlarson@mtu.edu)

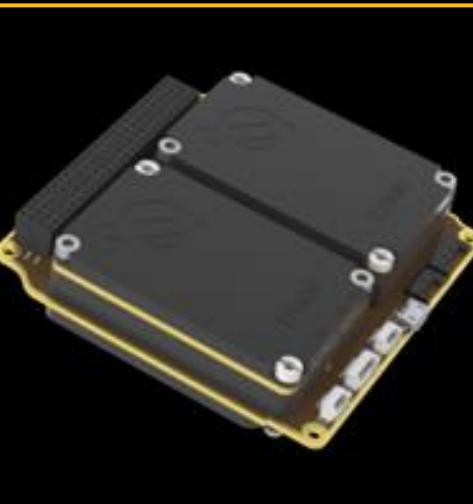

COM

# COM Overview

## What does COM do for the satellites?

- We make sure that the satellite can:
  - Receive commands from the ground
  - Send telemetry and mission data to Earth

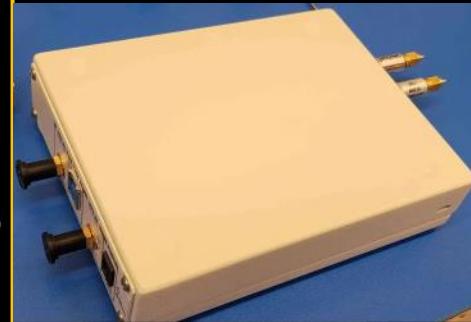

COM SR2000 Radio

## How does COM do that?

- With our radio and antenna!
- We prove that we can do this in space with:
  - Long-distance wireless testing

COM Patch Antenna

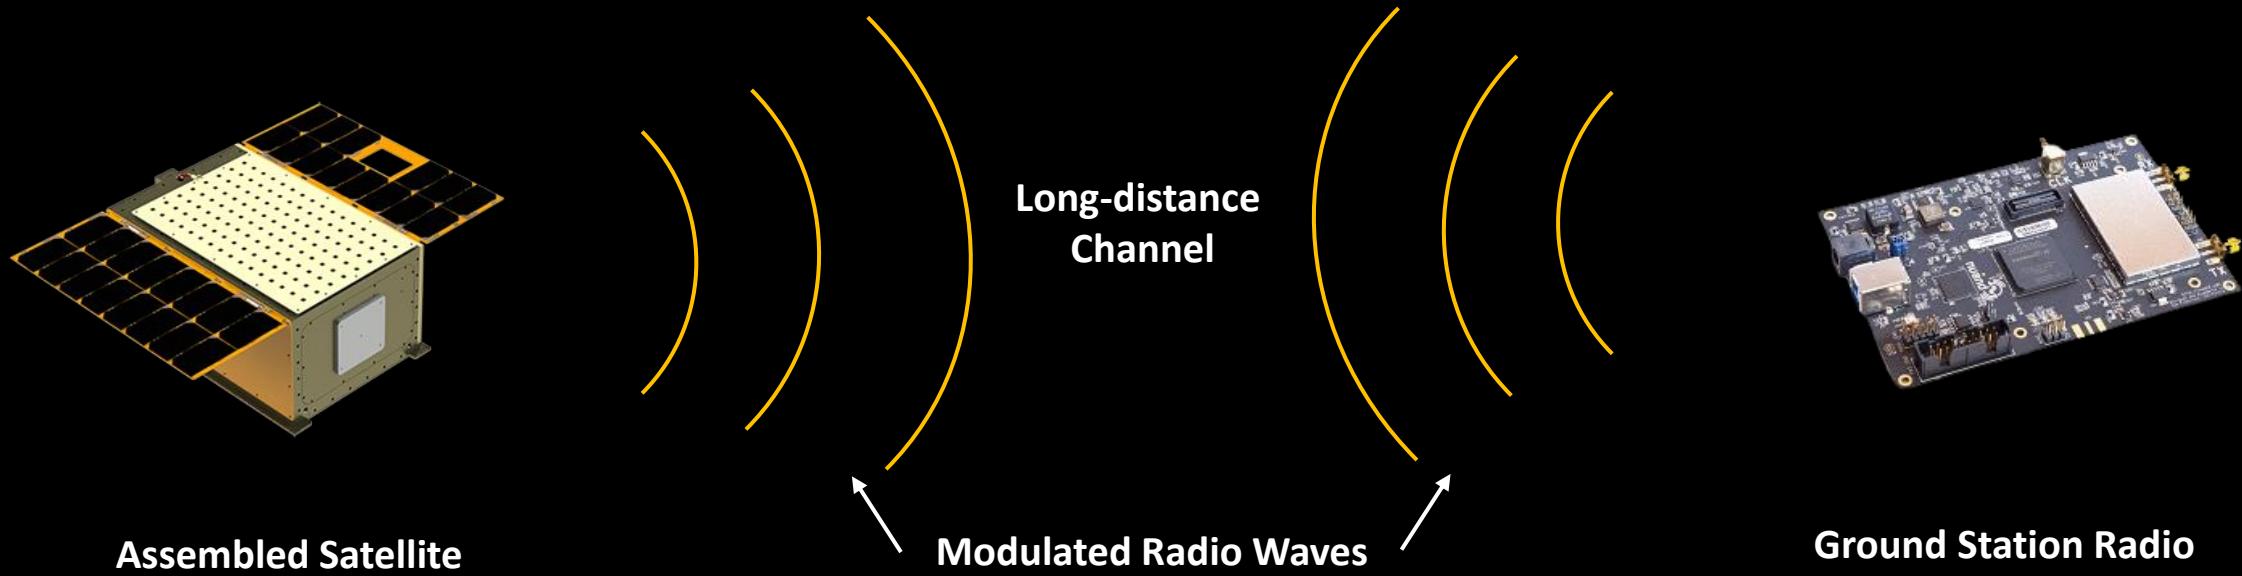

USRP Mock-GS SDR

COM

# On Earth Simulated Communications Test

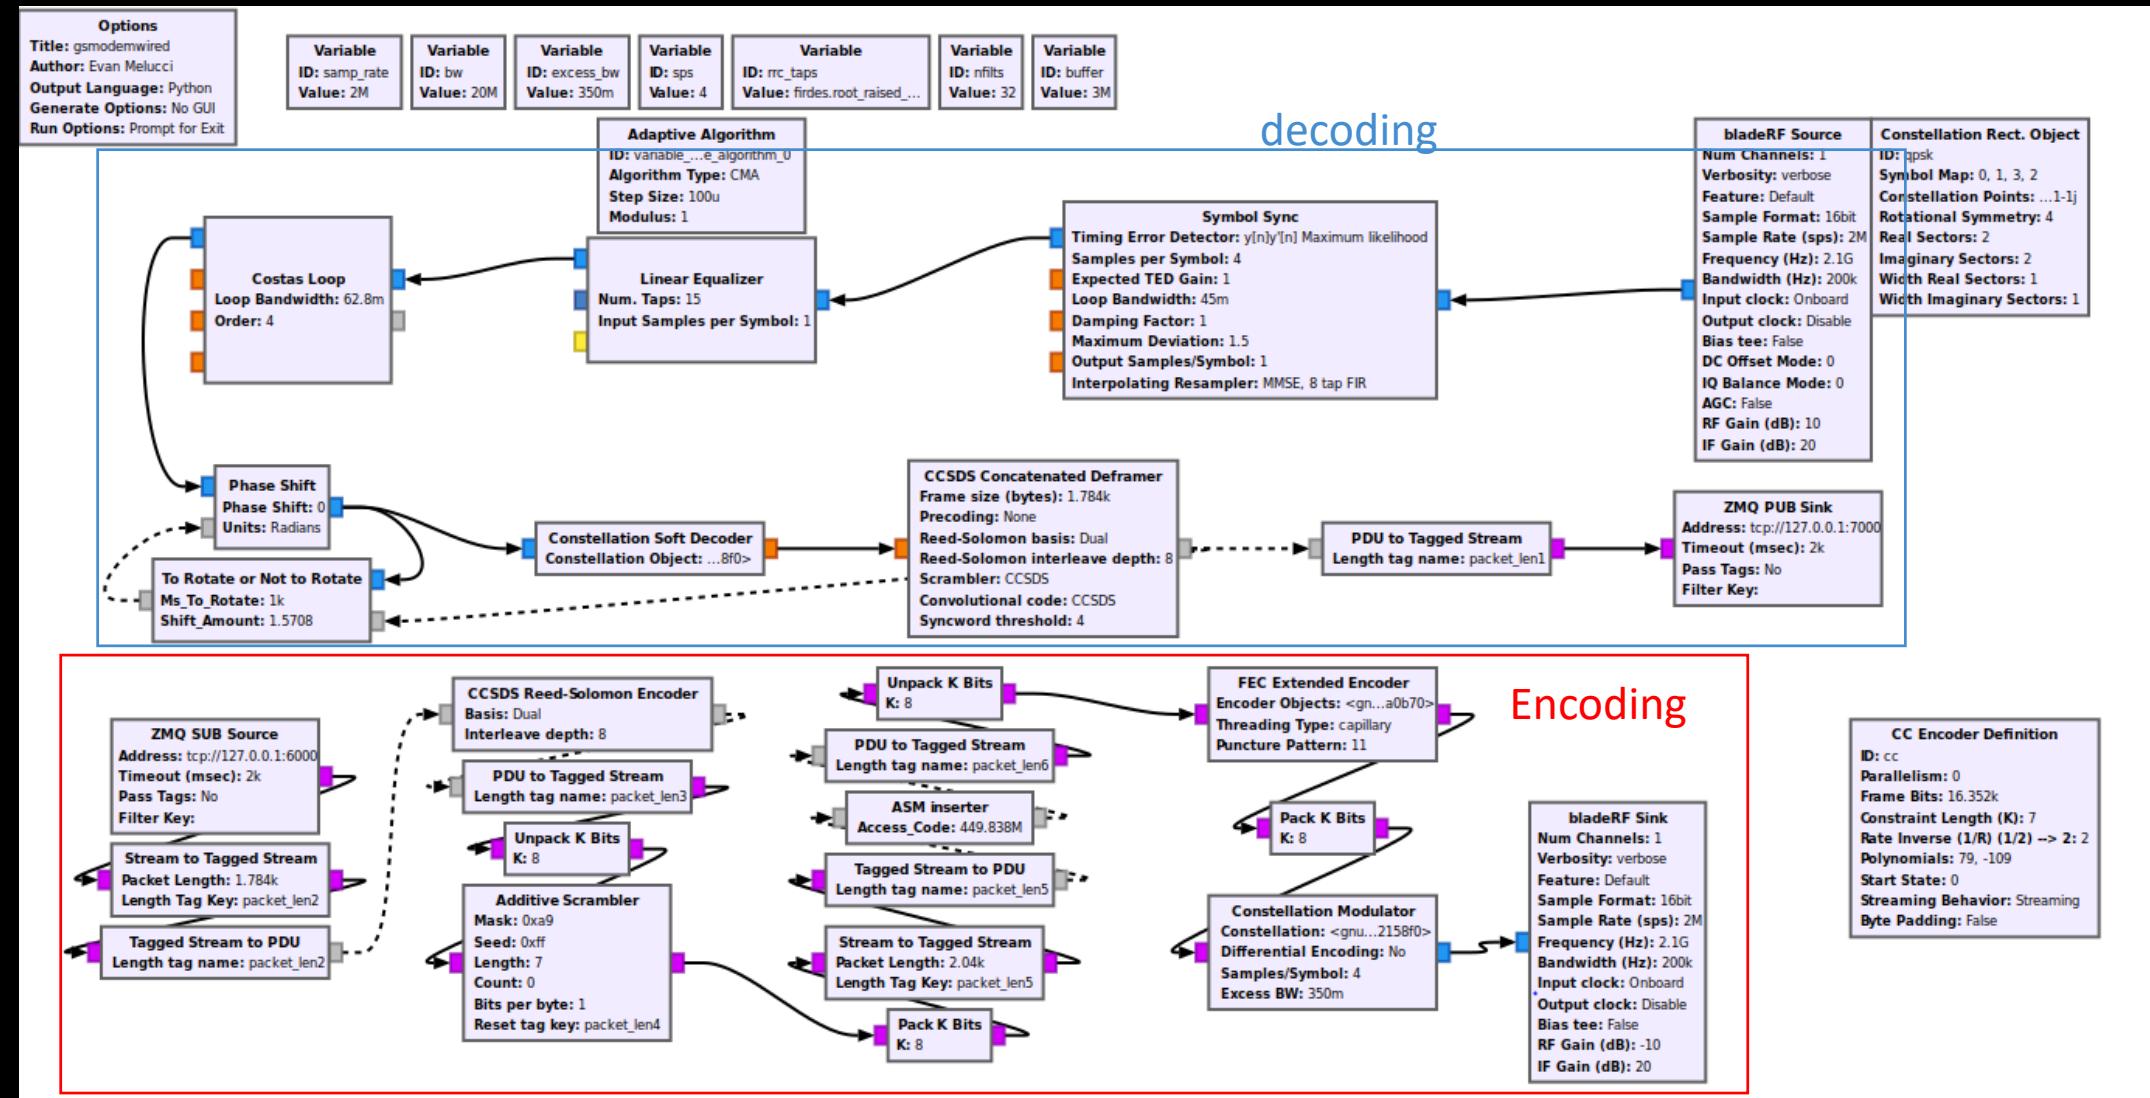

What's our job here?

- We need to:
  - Make sure the satellite can send/receive data over-the-air without error
- How?
  - Write software that allows the ground station radio to communicate with the satellite
  - Check if the satellite responds to commands and sends error-free data to the ground

COM

# Long-Distance

GNU Radio Testing Flowgraph

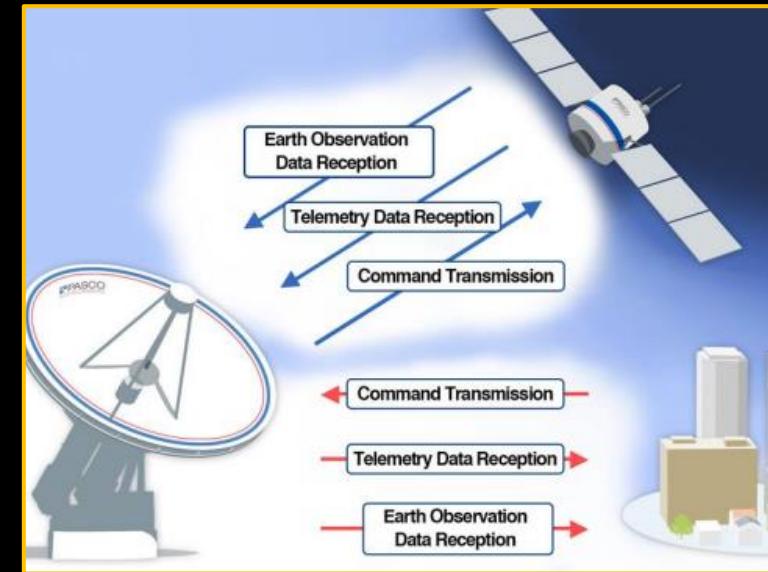

COM

# Why pick Communications?

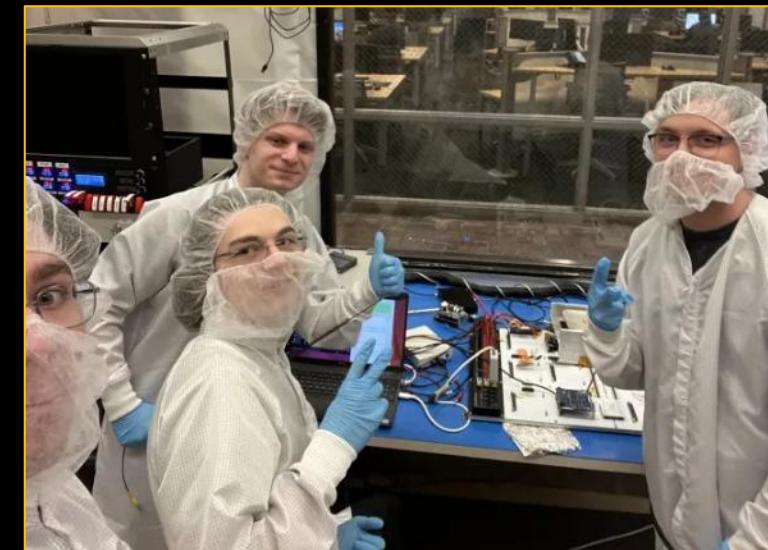

You should pick COM if...

- You are interested in, or want to learn more about:
  - Radio frequency (RF) design
  - Software Defined Radios
  - Testing physical RF equipment and hardware

Who are we looking for?

- EE, ME, CpE, and CS students, anyone interested in Radio-Frequency technology, electromagnetics and internet protocol configurations

# Electrical Power Systems (EPS)

**Team Leader**

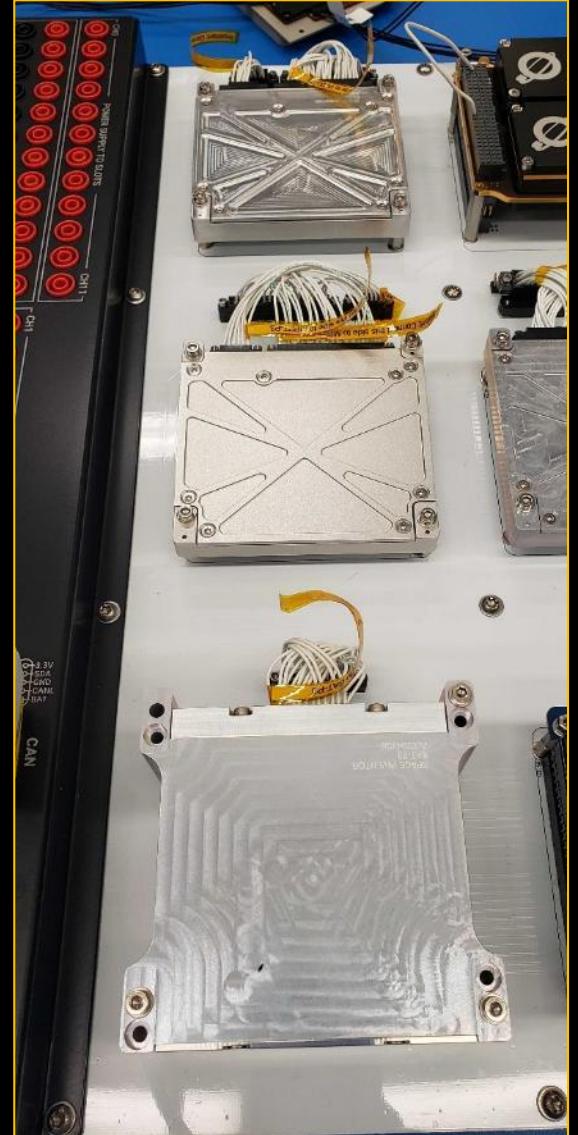

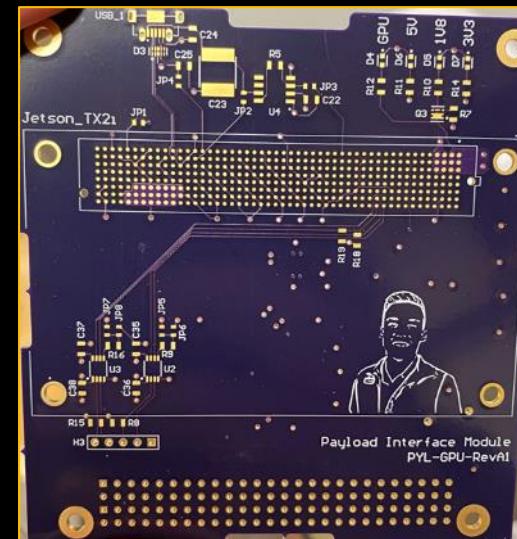

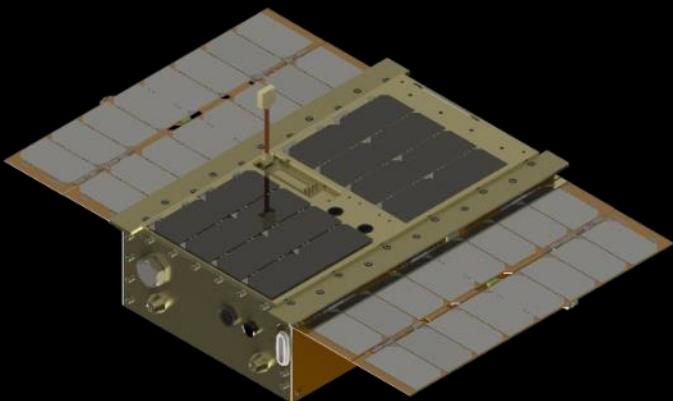

Luke Funk  
[lafunk@mtu.edu](mailto:lafunk@mtu.edu)

**Systems Engineer**

Sidney Draper  
[sn draper@mtu.edu](mailto:sn draper@mtu.edu)

# What is EPS?

- Electrical Power Systems collects, stores, and distributes power throughout the satellite
- Involves work with components such as solar panels, batteries, and custom printed circuit boards

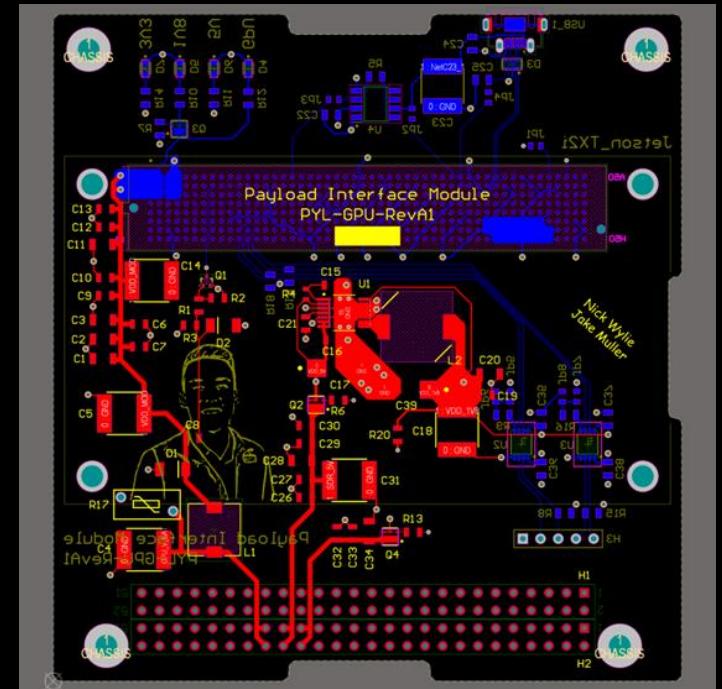

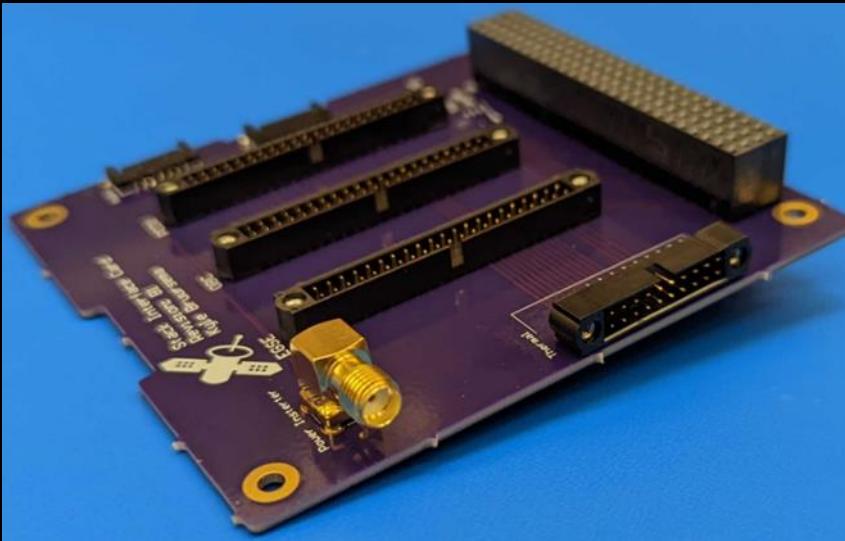

EPS

# What do we do?

Our team is currently:

- Testing components for integration within the clean room
- Designing, assembling, and testing printed circuit boards
- Creating wire connections between circuit boards, and components

EPS

# Join EPS

## Who are we looking for?

Looking for 4-5 new members:

Electrical Engineers

Computer Engineers

Mechanical Engineers

Anyone Willing to Learn

## Benefits

You can learn:

- Altium PCB Design
- Wire Harnessing
- Soldering
- Hardware Testing

No prior knowledge or experience is needed!

# Ground Support Equipment (GSE)

**Team Leader**

Ella Adams

[epadams@mtu.edu](mailto:epadams@mtu.edu)

**Systems Engineer**

Melissa Rochon

[mrochon@mtu.edu](mailto:mrochon@mtu.edu)

GSE

# Ground Support Equipment Overview

## EGSE

Electrical Ground Support Equipment (EGSE) – Supports testing of subsystem hardware and functionality tests.

## GSE

Clean Room – Manage the behind-the-scenes operations of our clean room, including humidity, maintenance, and upgrades.

GSE

# Ground Support Equipment Overview

We will accept any major, but are specifically looking for:

- EE's
- ME's

We have hands-on work with hardware this semester as well as design work!

## GSE Activities

- Satellite communication during testing
- Maintaining/improving clean room
- Testing the EGSE
- Operating the EGSE during satellite testing
- Creating and supporting satellite test procedures
- Electrical schematic design

MICHIGAN TECH  
**AEROSPACE**

**Systems Engineer**

Evan Weitzel  
[edweitze@mtu.edu](mailto:edweitze@mtu.edu)

SFW

# Overview

Remote Testing with ADC Team

- SFW develops the “brain” of the spacecraft that coordinates the functions of all other components
  - Drivers, test procedures, and mission code
  - Run test procedures on active hardware
  - Maintain and image the OBC

SFW

# How the Software Team Does It

- FreeRTOS (Real Time Operating System)
  - Common in embedded systems
  - Not taught in any classes!
- Using libraries to develop drivers for integrating different subsystem parts
  - Interdisciplinary learning – learn how to integrate subsystems from many different engineering disciplines
- Applied systems and embedded programming, primarily written in C
- Technical documentation
  - Test procedures, interface control

SFW

# Why Join Software?

- Develop code with practical applications for the Air Force and NASA
- Learn methods and paradigms used in the industry and gain experience working on an interdisciplinary team
- Gain connections in the Aerospace industry
- Looking for Computer Science, Computer Engineer, Software Engineer, and any interested developers

MICHIGAN TECH  
**AEROSPACE**  
ENTERPRISE

# Structures (STR)

**Team Leader**

# Thermal [THM]

**Team Leader**

Mack Klatt

[jkstatt@mtu.edu](mailto:jkstatt@mtu.edu)

**Systems Engineer**

Noor Saini

[hssaini@mtu.edu](mailto:hssaini@mtu.edu)

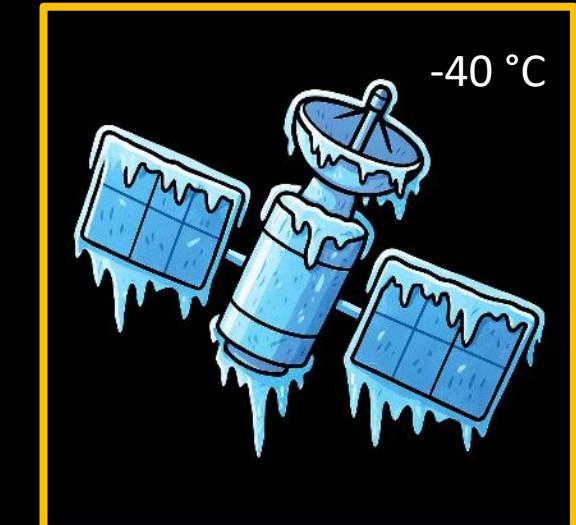

THM

# Overview

## ***The Harsh and Unforgiving Environment of Space***

- In Earth's shadow heat can escape quickly into the vacuum of space
- Lack of atmosphere means very little protection from the sun
- CubeSats are small and experience extremely fast temperature swings

## ***What does THM do?***

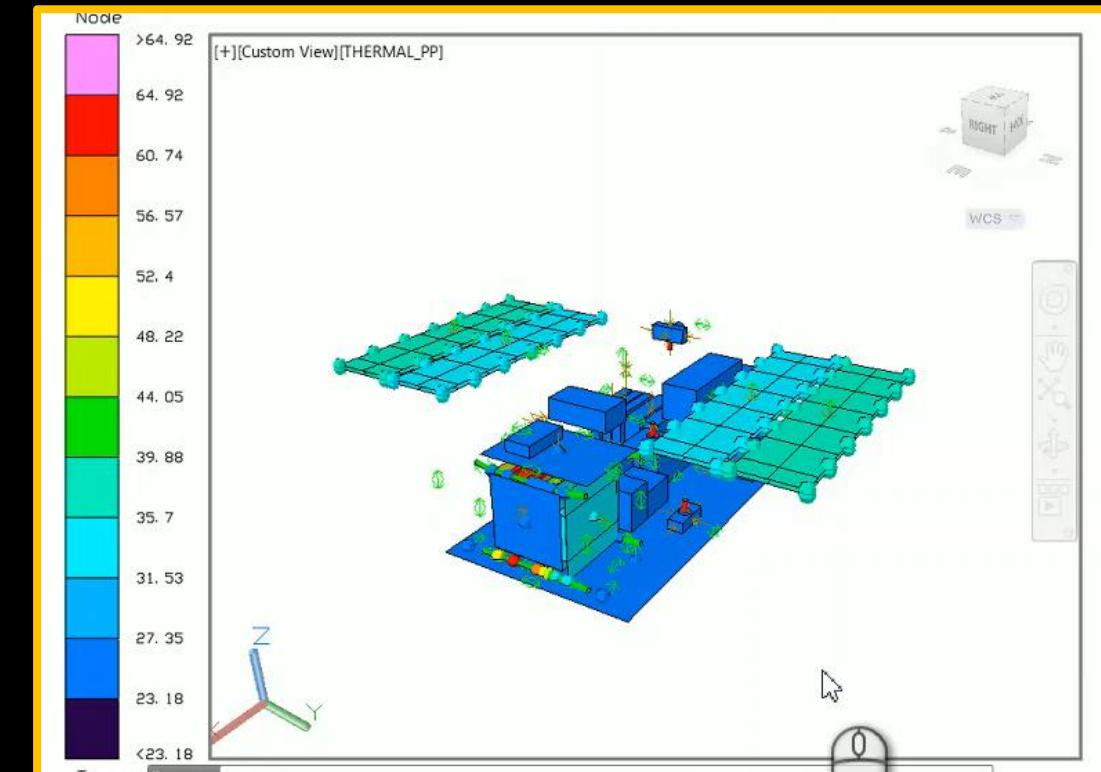

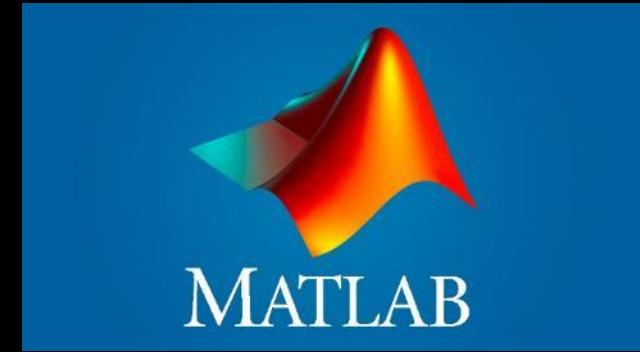

- Simulation focus to identify issues before they happen
- Work with STR, EPS, and other teams for solution integration
- Temperature sensors and thermistors to identify issues
- Thermal control systems, such as insulation, thermal interface materials, and heat sinks

## *How do we do it?*

- **Ansys Thermal Desktop**
  - Industry standard simulation software used for thermal analysis of spacecraft
- **Autodesk AutoCAD**
  - Modeling software used with Thermal Desktop to create simulation models
- **MATLAB**
  - Programming designed for engineers to compare analyze simulation and experimental data
- **Physical Testing**
  - Testing thermistors to ensure accurate data is being gathered

THM

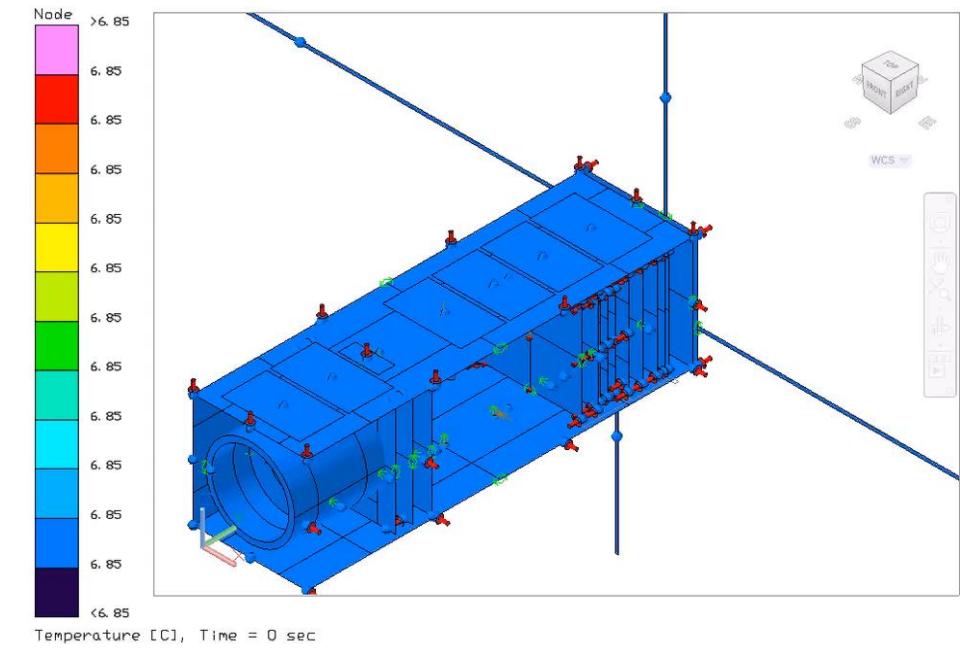

# Opportunities

## **Majors**

- Majority have Mechanical Engineering
- **All majors welcome!** We offer training in all our software!

## **Why You Should Join THM:**

- Aerospace industry standard software that are huge resume boosters
- Gain advanced knowledge of FEA simulation techniques
- Hands-on testing and integration of temperature sensors and thermistors

## **Interested?**

- Feel free to email any questions to

# Joining the Team

## MEMBERSHIP REQUIREMENTS

6

- Must be an Undergraduate Student at Michigan Technological University
- Students must have completed one entire semester at Michigan Tech
- Students must be enrolled in an Enterprise Project Work Course
- Students must be a U.S. Citizen

STEP 1

### Attend an Information Session

Learn about the Enterprise and the different subteams

STEP 2

### Complete the Application Process

Scan/Take a picture of the QR Code!

Applications for Fall 2024 will be due Sunday, Oct. 26<sup>th</sup> at midnight!

Please fill out the application form to apply to our program!

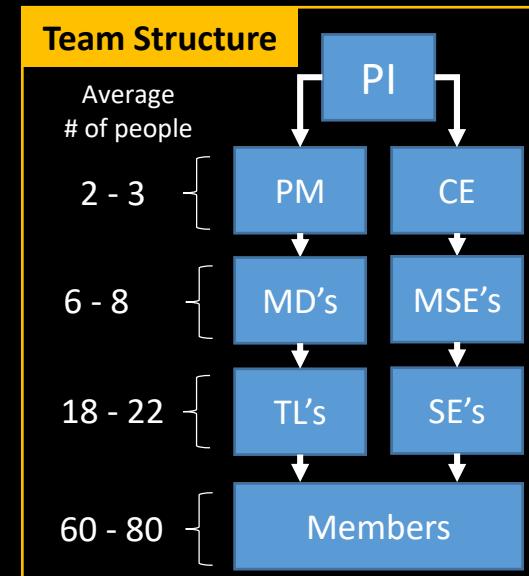

## What does the application process look like?

- 1. Application Submission:** Submit your resume and fill out the application form
- 2. Leadership Review:** Leadership team reviews the above submissions and selects people to interview
- 3. Interview Process:** Leadership team interviews potential candidates and ask more in-depth questions of the applicant to gauge team fit
- 4. Acceptance/Rejection:** Once leadership review and all interviews are complete, notification emails will be sent out to all applicants. Those who were accepted will be automatically enrolled.

## How bureaucratic is the Enterprise?

- We have a well-defined layout, organizational structure, and set projects.
- This structure exists because a satellite is incredibly complex, and everything is interconnected. We are required to keep an extensive body of documentation to prove adherence to design requirements and demonstrate compliance with safety regulations.
- We are modeled very close to an actual aerospace firm. What you do here will echo what is done in the actual aerospace industry.
- Our team has access to controlled information & Technology. We are required to observe U.S. Law and International Regulations.
- Like all companies, we also make a lot of great friends and connections!

# FAQ's Cont.

## How likely am I to get an aerospace job?

- That depends on how much work you put into the team and how well you differentiate yourself.
- Students who put over 8 hours a week into the enterprise while maintaining good academic standing have a very high chance of getting aerospace/defense internships, co-ops, and jobs. *General* employment rate from our team is ~95%.
- Alumni regularly reach out to us asking for students on the team (that stand out) to work at their company or agency.

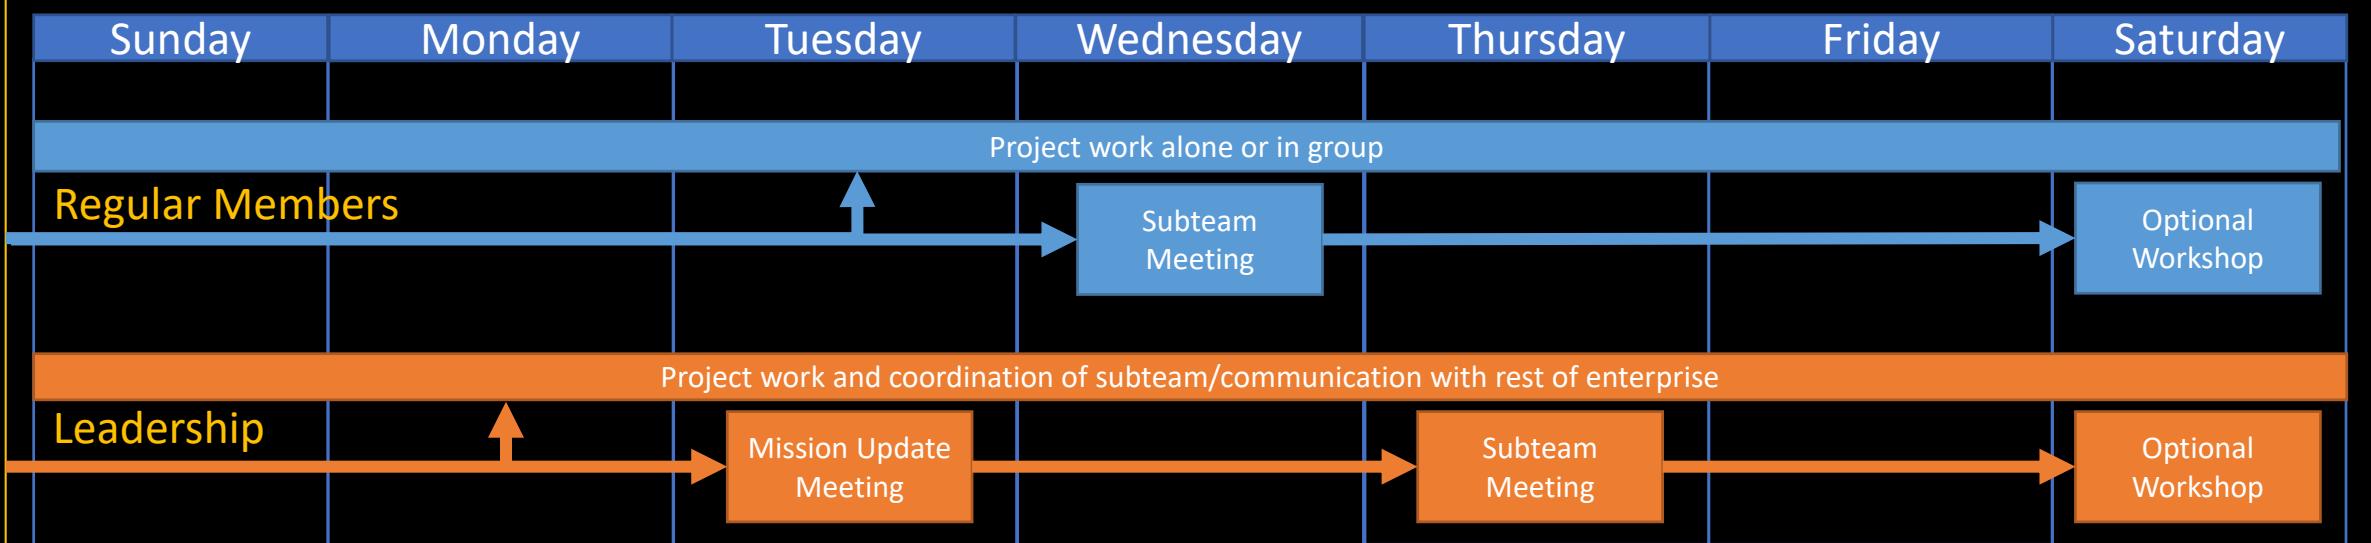

## How much work will I do?

- The enterprise is what you make of it. As long as you maintain a BC or higher and put 3-5 hours per week, you'll tread water alright, but won't learn much.
- There is always room for you to pick up more responsibility if you want. Let us know and we'll fill your plate. You get more important work as you gain experience.
- If you somehow still want more work, leadership roles become available every few semesters. These positions usually require 8 or more hours per week and involve leading a group of 3-20 people.
- Members of the leadership team also get to travel to conferences and technical reviews to represent our team and our University in public settings.

What does a regular week look like?

- Note that the above is very generalized and does not include random events like hardware testing, design reviews, and conferences.
- Events not covered here:
  - A monthly all-hands meeting (for everyone)
  - A monthly Aerospace guest lecture/recruitment session (for everyone)
  - A monthly recruitment/outreach event (leadership only)
- Always remember: *the work you put in = the opportunities you get out the team*

## How does networking work on the Enterprise?

We strive to be a professional network as well as a training opportunity for students. The aerospace sector is smaller than you think. Your peer could be your interviewer one day (or vice versa), so it's always important to try your hardest and be friendly with the rest of the team; we're in this together after all. Networking and employment on the Aerospace Enterprise is done in the following ways:

- Alumni reach out to Dr. King or leadership asking for names/resumes of current students.
- Hardware/software vendors reach out to students that use their product a lot.
- Certain companies/agencies fly to Tech to give info sessions on why we should work to them.
- Companies/agencies with aerospace alumni target current members with relevant experience at career fair.
- Your older peers sometimes reference you to their future/current place of employment for consideration.
- Networking with industry at aerospace conferences

## Where can I learn more about the team?
